

# Photon Technical Overview

# Agenda

- Motivation/Background on Photon
  - Performance
  - Using the feature
  - Supported Functionalities

# Photon is Databricks' next generation query engine, built to be faster than anyone else

**100% APACHE SPARK COMPATIBLE** query engine

Built from the ground up to deliver the **FASTEST PERFORMANCE**

**FOR ALL DATA USE CASES\***  
across data engineering, data science,  
machine learning, and data analytics.

⚡ Photon

# Building the next generation query engine

- Re-architected for the fastest performance on real-world applications
  - Native C++ engine for faster queries
  - Custom built memory management to avoid JVM bottlenecks
  - Vectorized: memory, instruction, and data parallelism (SIMD)
- Works with your existing code and avoids vendor lock-in
  - 100% compatible with open source Spark DataFrame APIs and Spark SQL
  - Transparent operation to users - no need to invoke something new, it just works
- Optimizing for all data use cases and workloads
  - Today, supporting SQL and DataFrame workloads
  - Coming soon, Streaming, Data Science, and more

# Photon in the Databricks Lakehouse Platform

Client: Submit SQL Query

- Parsing
- Catalyst: Analysis/Planning/Optimization
- Scheduling

# Create a Cluster with Photon Enabled

Create clusters with the flexibility to choose photon runtime or non-photon runtime

**Create Cluster** [Cancel] [Create]

Policy: Free Form

Cluster Name:

Cluster Mode: Standard

Pool: None

Databricks Runtime Version: 8.2 GPU, Scala 2.12, Spark 3.0.1

Upgraded performance with Photon: ☒

Environment	Runtime versions
Standard >	8.2 Scala 2.12, Spark 3.1.1
ML >	
Genomics >	

Driver Type: r3.2xlarge

Workers: Max Workers:

Advanced Options

**Create Cluster** [Cancel] [Create]

Policy: Free Form

Cluster Name:

Cluster Mode: Standard

Pool: None

Databricks Runtime Version: 8.2 GPU, Scala 2.12, Spark 3.0.1

Upgraded performance with Photon: ☐

Environment	Runtime versions
Standard >	8.2 Scala 2.12, Spark 3.1.1
ML >	8.1 Scala 2.12, Spark 3.1.1
Genomics >	8.0 Scala 2.12, Spark 3.1.1
	7.6 Scala 2.12, Spark 3.0.1
	7.5 Scala 2.12, Spark 3.0.1
	7.4 Scala 2.12, Spark 3.0.1
	7.3 Scala 2.12, Spark 3.0.1
	4 more

Workers: Max Workers:

DBU / hour: 2-8 Photon i3.2xlarge

DBU count now driven by 2 factors: the photon runtime version vs. non-photon version, and size of the VMs.

When customers choose photon runtime, the DBU count for this cluster increases

Clear pricing indication presented to assist decision making for price-performance trade-off.

# Ideal Job Profile

- Azure Instances

- D (general), E (memory), L (storage) w/ or w/o Delta Cache Acceleration
- Additive features: ([blog on L8as\\_v3 w/ Photon](#))
  - s: premium storage
  - a: AMD-based processor

- Longest running jobs (at least 10 min)

- Focus on the longest running / most expensive jobs to make the biggest impact

- Batch Job (not streaming)

- No UDFs

- CPU bound

- Reads and Writes to/from Delta

# Overview of Query Coverage

## Data Types

- ✓ Byte/Short/Int/Long
- ✓ Boolean
- ✓ String/Binary
- ✓ Decimal
- ✓ Float/Double
- ✓ Date/Timestamp
- ✓ Struct
- ✓ Array, Map

## Operators

- ✓ Scan, Filter, Project
- ✓ Hash Aggregate/Join/Shuffle
- ✓ Nested-Loop Join
- ✓ Null-Aware Anti Join
- ✓ Union, Expand, ScalarSubquery

**Coming soon: Sort, Window**

## Expressions

- ✓ Comparison / Logic
- ✓ Arithmetic / Math (most)
- ✓ Conditional (IF, CASE, etc.)
- ✓ String (common ones)
- ✓ Casts
- ✓ Aggregates (most common ones)
- ✓ Date/Timestamp (in progress)

**Coming soon: UDFs, long tail**

# Key Photon Characteristics

- Hybrid Photon/Spark Plans
  - Use Photon when possible, fall back to Spark for unsupported operations
- Native code using off-heap memory
- Fully integrated with Spark's memory manager
- Prefers hash join over sort-merge join
- Rich per-operator performance metrics
