1.1 Knowledge Representation

Artificial Intelligence (AI)

such behavior. intelligent behavior, and with the creation of artifacts that exhibit computational understanding of what is commonly called A field of computer science and engineering concerned with the

Knowledge Representation

designing, and implementing ways of representing information in computers so that programs (agents) can use this information A subarea of Artificial Intelligence concerned with understanding,

- to derive information that is implied by it,
- to converse with people in natural languages,
- to decide what to do next
- to plan future activities,
- to solve problems in areas that normally require human expertise

Reasoning

present is a form of reasoning. Deriving information that is implied by the information already

to reason with them. Knowledge representation schemes are useless without the ability

So, Knowledge Representation and Reasoning (KRR)

Manifesto of KRR

it. John McCarthy, "Programs with Common Sense", 1959. capable of learning something it must first be capable of being told told and what it already knows... In order for a program to be sufficiently wide class of immediate consequences of anything it is a program has common sense if it automatically deduces for itself a

Knowledge vs. Belief

Knowledge: justified true belief.

John believes that the world is flat: Not true.

always end in a tie. Sally believes that the first player in chess can always win, and Mary believes that, with optimal play on both sides, chess will Betty believes that the second player can always win,

One of them is correct,

but none are justified.

So Belief Representation & Reasoning: more accurate But we'll continue to say KRR.

In Class Exercise

"An Approach to Serenity"

Therefore every smart student studies.

studied. Tuesday evening, Jack either went to the movies, played bridge, or

Tuesday evening, Jack played bridge.

evening. Therefore, Jack neither went to the movies nor studied Tuesday

How We Understand Them. Background Knowledge: Some Sentences and

John likes ice cream.

John likes to eat ice cream.

Mary likes Asimov. Mary likes to read books written by Isaac Asimov.

Background Knowledge: Some Sentences and

How We Understand Them.

Bill flicked the switch.

The room was flooded with light.

come on, which lit up the room Bill was in. Bill moved the switch to the "on" position, which caused a light to

Betty opened the blinds.

The courtyard was flooded with light.

on the other side of the window was bright. they were in front of, after which she could see that the courtyard Betty adjusted the blinds so that she could see through the window

Memory Integration in Humans

After seeing these sentences (among others),

The sweet jelly was on the kitchen table.

The ants in the kitchen ate the jelly.

The ants ate the sweet jelly that was on the table.

The jelly was on the table.

The sweet jelly was on the table

The ants ate the jelly.

subjects, with high confidence reported that they had seen the sentence.

The ants ate the sweet jelly that was on the kitchen table.

 $\mathtt{http://www.rpi.edu/}{\sim}\mathtt{verwyc/cognotes5.htm.}$ Psychology, 2, 331-350, as reported on [Bransford and Franks (1971). The abstraction of linguistic ideas. Cognitive

Requirements for a Knowledge-Based Agent

- 1. "what it already knows" [McCarthy '59]
- A knowledge base of beliefs.
- 2. "it must first be capable of being told" [McCarthy '59] A way to put new beliefs into the knowledge base.
- "automatically deduces for itself a sufficiently wide class of immediate consequences" [McCarthy '59]
- in the knowledge base. A reasoning mechanism to derive new beliefs from ones already

1.2 Logic

- Logic is the study of correct reasoning.
- It is not a particular KRR language.
- There are many systems of logic (logics).
- AI KRR research can be seen as a hunt for the "right" logic.

Commonalities among Logics

- System for reasoning.
- Prevent reasoning from "truths" to "falsities". falsities.) (But can reason from truths and falsities to truths and
- Language for expressing reasoning steps.

Parts of the Study/Specification of a Logic

Syntax: The atomic symbols of the logical language, and the rules structures) of the logic. for constructing well-formed, nonatomic expressions (symbol

Semantics: The meanings of the atomic symbols of the logic, and expressions of the logic the rules for determining the meanings of nonatomic

Proof Theory: The rules for determining a subset of logical expressions, called **theorems** of the logic.

Propositional Logic

Logics that do not analyze information below the level of the

proposition.
2.1 What is a Proposition?
2.2 CarPool World: A Motivational "Micro-World"
2.3 The "Standard" Propositional Logic
2.4 Important Properties of Logical Systems
25 Clause Form Propositional Logic 136

2.1 What is a Proposition?

An expression in some language

- that is true or false
- whose negation makes sense
- that can be believed or not
- whose negation can be believed or not
- that can be put in the frame "I believe that it is not the case that

Examples

Of propositions

- Betty is the driver of the car.
- If Opus is a penguin, then Opus doesn't fly.

Barack Obama is sitting down or standing up.

Of non-propositions

- Barack Obama
- how to ride a bicycle
- If the fire alarm rings, leave the building.

Sentences vs. Propositions

exclamation point. with a capital letter and ends with a period, question mark, or A sentence is an expression of a (written) language that begins

Some sentences do not contain a proposition:

"Hi!", "Why?", "Pass the salt!"

Some sentences do not express a proposition, but contain one: "Is Betty driving the car?"

Some sentences contain more than one proposition: If Opus is a penguin, then Opus doesn't fly.

CarPool World: A Motivational "Micro-World"

- Tom and Betty carpool to work.
- On any day, either Tom drives Betty or Betty drives Tom. In the former case, Tom is the driver and Betty is the passenger.
- In the latter case, Betty is the driver and Tom is the passenger

Betty drives Tom.

Tom drives Betty.

Propositions: Betty is the driver.

Tom is the driver.

Betty is the passenger. Tom is the passenger.

2.3.1Syntax of the "Standard" Propositional Logic

Atomic Propositions

- Any letter of the alphabet, e.g.: P
- Any letter of the alphabet with a numerical subscript, e.g.: Q_3
- Any alphanumeric string, e.g.: Tom is the driver

is an atomic proposition.

Well-Formed Propositions (WFPs)

- 1. Every atomic proposition is a wfp.
- 2. If P is a wfp, then so is $(\neg P)$
- 3. If P and Q are wfps, then so are

(a)
$$(P \wedge Q)$$
 (b) $(P \vee Q)$

(c)
$$(P \Rightarrow Q)$$
 (d) $(P \Leftrightarrow Q)$

4. Nothing else is a wfp.

Parentheses may be omitted. Precedence: \neg ; \land , \lor ; \Rightarrow ; \Leftrightarrow .

Square brackets may be used instead of parentheses. Will allow $(P_1 \wedge \cdots \wedge P_n)$ and $(P_1 \vee \cdots \vee P_n)$.

Examples of WFPs

$$\neg (A \land B) \Leftrightarrow (\neg A \lor \neg B)$$

Betty drives $Tom \Leftrightarrow \neg Tom \text{ is the driver}$

Tom is the driver \Rightarrow Betty is the passenger

Alternative Symbols

A Computer-Readable Syntax for Wfps

Based on CLIF, the Common Logic Interchange Format^a

Atomic Propositions: Use one of:

Embedded underscores: Betty_drives_Tom

Embedded hyphens: Betty-drives-Tom

CamelCase: BettyDrivesTom

sulkingCamelCase: bettyDrivesTom

Escape brackets: |Betty drives Tom|

Quotation marks: "Betty drives Tom"

CLIF Form	Print Form

Semantics of Atomic Propositions 1 **Intensional Semantics**

- Dependent on a Domain.
- Independent of any specific
- situation. Statement in a previously understood language (e.g. English) interpretation/model/possible world/situation. that allows truth value to be determined in any specific
- Often omitted, but shouldn't be.

Intensional CarPool World Semantics

 $[Betty\ drives\ Tom] = Betty\ drives\ Tom\ to\ work.$

 $[Tom\ drives\ Betty] = Tom\ drives\ Betty\ to\ work.$

 $[Betty \ is \ the \ driver] = Betty \ is the driver of the car.$

[Tom is the driver] = Tom is the driver of the car.

 $[Betty\ is\ the\ passenger] = Betty\ is\ the\ passenger\ in\ the\ car.$

[Tom is the passenger] = Tom is the passenger in the car.

Alternative Intensional CarPool World Semantics

 $[Betty\ drives\ Tom] = Tom\ drives\ Betty\ to\ work.$

 $[Tom \ drives \ Betty] = Betty \ drives \ Tom \ to \ work.$

[Betty is the driver] = Tom is the passenger in the car.

[Tom is the driver] = Betty is the passenger in the car.

 $[Betty \ is \ the \ passenger] = Tom \ is the driver of the car.$

[Tom is the passenger] = Betty is the driver of the car.

Syntax/Intensional Semantics Alternative CarPool World

[A] = Betty drives Tom to work.

[B] = Tom drives Betty to work.

[C] = Betty is the driver of the car.

[D] = Tom is the driver of the car.

[E] = Betty is the passenger in the car.

[F] = Tom is the passenger in the car.

Intensional Semantics Moral

- Don't omit.
- Don't presume.
- No "pretend it's English semantics".

Intensional Semantics of WFPs

 $[\neg P] = \text{It is not the case that } [P].$

 $[P \wedge Q] = [P]$ and [Q].

 $[P \lor Q] = \text{Either } [P] \text{ or } [Q] \text{ or both.}$

 $[P \Rightarrow Q] = \text{If } [P] \text{ then } [Q].$

 $[P \Leftrightarrow Q] = [P]$ if and only if [Q].

Example CarPool World Intensional WFP Semantics

= Betty drives Tom to work [Betty drives $Tom \Leftrightarrow \neg Tom \ is \ the \ driver$] if and only if Tom is not the driver of the car.

Terminology

- $\neg P$ is called the **negation** of P.
- $P \wedge Q$ is called the **conjunction** of P and Q. P and Q are referred to as conjuncts
- $P \lor Q$ is called the **disjunction** of P and Q. P and Q are referred to as **disjuncts**
- $P \Rightarrow Q$ is called a **conditional** or **implication**. Q as the consequent P is referred to as the **antecedent**;
- $P \Leftrightarrow Q$ is called a **biconditional** or **equivalence**.

2.3.2Semantics of Atomic Propositions 2

Extensional Semantics

- Relative to an interpretation/model/possible world/situation.
- Either True or False.

Extensional CarPool World Semantics

		Denotat	tion in S	Denotation in Situation	L
Proposition	<u> </u>	2	ယ	4	S
Betty drives Tom	True	True	True	False	False
Tom drives Betty	True	True	False	True	False
Betty is the driver	True	True	True	False	False
Tom is the driver	True	False	False	True	False
Betty is the passenger	True	False	False	True	False
Tom is the passenger	True	False	True	False	False

Note: n propositions $\Rightarrow 2^n$ possible situations.

6 propositions in CarPool World $\Rightarrow 2^6 = 64$ different situations.

Extensional Semantics of WFPs

 $\llbracket \neg P \rrbracket$ is True if $\llbracket P \rrbracket$ is False. Otherwise, it is False.

False. $[\![P \land Q]\!]$ is True if $[\![P]\!]$ is True and $[\![Q]\!]$ is True. Otherwise, it is

 $\llbracket P \lor Q \rrbracket$ is False if $\llbracket P \rrbracket$ is False and $\llbracket Q \rrbracket$ is False. Otherwise, it is

 $[\![P\Rightarrow Q]\!]$ is False if $[\![P]\!]$ is True and $[\![Q]\!]$ is False. Otherwise, it is

Otherwise, it is False $[\![P\Leftrightarrow Q]\!]$ is True if $[\![P]\!]$ and $[\![Q]\!]$ are both True, or both False

given the truth values of its atomic propositions Note that this is the outline of a recursive function that evaluates a wfp,

Extensional Semantics Truth Tables

$\neg P$	P
False	True
True	False

$P \Leftrightarrow Q$	$P \Rightarrow Q$	$P \lor Q$	$P \wedge Q$	Q	P
True	True	True	True	True	True
False	False	True	False	False	True
False	True	True	False	True	False
True	True	False	False	False	False

Notice that each column of these tables represents a different situation.

Material Implication

 $P \Rightarrow Q$ is True when P is False.

So,

implication. is considered True if $if \dots then$ is interpreted as material If the world is flat, then the moon is made of green cheese

$$(P \Rightarrow Q) \Leftrightarrow (\neg P \lor Q)$$

$\neg P \lor Q$	$P \Rightarrow Q$	$\neg P$	Q	P
True	True	False	True	True
False	False	False	False	True
True	True	True	True	False
True	True	True	False	False

 $(P\Rightarrow Q)$ is sometimes taken as a abbreviation of $(\neg P\lor Q)$ Note: "Uninterpreted Language", Formal Logic,

applicable to every logic in the class.

Example CarPool World Truth Table

False	True	True	False	Betty drives $Tom \Leftrightarrow \neg Tom is the driver$
True	False	True	False	$\neg Tom is the driver$
False	True	False	True	Tom is the driver
False	False	True	True	Betty drives Tom

Computing Denotations

Use the procedure sketched on page 41.

Use Spreadsheet:

See http://www.cse.buffalo.edu/~shapiro/Courses/CSE563/ truthTable.xls/

Use Boole program from Barwise & Etchemendy package

Computing the Denotation of a Wfp in a Model

the desired model. whose denotation is to be computed, and restrict the truth table to Construct a truth table containing all atomic wfps and the wfp

E.g., play with http:

//www.cse.buffalo.edu/~shapiro/Courses/CSE563/cpw.xls/

Use the program /projects/shapiro/CSE563/denotation

Example Runs of denotation Program

```
True
False
                                                                                                                                                                                                                                                                cl-user(1): (denotation '(if p (if q p))
                                                                                                                                                  cl-user(2): (denotation
                                                                                                                '(if BettyDrivesTom
                                                      '((BettyDrivesTom . True)
                        (TomIsThePassenger . True)))
                                                                                    (not TomIsThePassenger))
                                                                                                                                                                                                                                      '((p . True) (q . False)))
```

Model Finding

A model satisfies a wfp if the wfp is True in that model.

If a wfp P is False in a model, \mathcal{M} , then \mathcal{M} satisfies $\neg P$.

A model satisfies a set of wfps if they are all True in the model. A model, \mathcal{M} , satisfies the wfps P_1, \ldots, P_n if and only if \mathcal{M} , satisfies

Task: Given a set of wfps, A, find satisfying models.

I.e., models that assign all wfps in A the value True.

Model Finding with a Spreadsheet

Play with http:

//www.cse.buffalo.edu/~shapiro/Courses/CSE563/cpw.xls/

An Informal Model Finding Algorithm (Exponential)

- Given: Wfps labeled True, False, or unlabeled.
- If any wfp is labeled both True and False, terminate with failure
- If all atomic wfps are labeled, return labeling as a model.
- If $\neg P$ is
- labeled True, try labeling P False.
- labeled False, try labeling P True.
- If $P \wedge Q$ is
- labeled True, try labeling P and Q True.
- labeled False, try labeling P False, and try labeling Q False.

Model Finding Algorithm, cont'd

If $P \vee Q$ is

- labeled False, try labeling P and Q False.
- labeled True, try labeling P True, and try labeling Q True.

• If $P \Rightarrow Q$ is

- labeled False, try labeling P True and Q False.
- labeled True, try labeling P False, and try labeling Q True.

• If $P \Leftrightarrow Q$ is

- and try labeling P and Q both False. labeled True, try labeling P and Q both True,
- labeled False, try labeling P True and Q False, and try labeling P False and Q True.

                                                                                                                                                                                                                              In a SubDomain of Propositional Car Pool World
```

;;; A set of well-formed propositions to find models of within CPW proposition BettyIsPassenger ; Betty is the passenger in the proposition TomIsDriver; Tom is the driver of the car. (BettyIsPassenger -> !BettyIsDriver). !!BettyIsDriver. (TomIsDriver -> BettyIsPassenger)

Decreasoner Example Run

```
<timberlake:decreasoner:1:60> python ubdecreasonerP.py
examples/ShapiroCSE563/cpwPropFindModels.e
```

model 1:

BettyIsDriver.

!BettyIsPassenger.

!TomIsDriver.

Semantic Properties of WFPs

- A wfp is **satisfiable** if it is True in at least one situation.
- A wfp is **contingent** if it is True in at least one situation and False in at least one situation.
- A wfp is **valid** ($\models P$) if it is True in every situation. A valid wfp is also called a tautology.
- A wfp is unsatisfiable or contradictory if it is False in every situation.

Examples

False True False False False	$P \land \neg P$ False	$P \Rightarrow (Q \Rightarrow P)$ True	$Q \Rightarrow P$ True	$\neg P$ False	Q True	P True
			True I	False [False [True I
	False False	Irue True	alse True	Irue True	True False	false False

 $\neg P, Q \Rightarrow P$, and $P \Rightarrow (Q \Rightarrow P)$ are satisfiable, $\neg P$ and $Q \Rightarrow P$ are contingent,

 $P \Rightarrow (Q \Rightarrow P)$ is valid,

 $P \wedge \neg P$ is contradictory.

Logical Entailment

 $\{A_1,\ldots,A_n\}$ logically entails B in logic \mathcal{L}

$$A_1,\ldots,A_n\models_{\mathcal{L}} B$$

if B is True in every situation in which every A_i is True.

If \mathcal{L} is assumed,

$$A_1,\ldots,A_n\models B$$

If n = 0, we have validity

$$\models B$$
,

i.e., B is True in every situation.

Examples

$P \wedge \neg P$ False False F	$P \Rightarrow (Q \Rightarrow P)$ True True T	$Q \Rightarrow P$ True True F	$\neg P \hspace{1cm} \Big \hspace{1cm} ext{False} \hspace{1cm} T$	$oxed{Q}$ True False T	P True True F
lse False	ue True	ue False	lse True	lse True	ue False
False	True	True	True	False	False

$$\models P \Rightarrow (Q \Rightarrow P)$$

$$P \models Q \Rightarrow P$$

$$Q, Q \Rightarrow P \models P$$

Page 64

A Metatheorem

$$A_1, \dots, A_n \models B$$

$$\text{iff}$$

$$A_1 \land \dots \land A_n \models B$$

Semantic Deduction Theorem (Metatheorem)

$$A_1, \ldots, A_n \models P$$
 if and only if $\models A_1 \land \cdots \land A_n \Rightarrow P$.
So deciding validity and logical entailment are equivalent.

Domain Knowledge (Rules)

Used to reduce the set of situations to those that "make sense".

Domain Rules for CarPool World

Betty is the driver $\Leftrightarrow \neg Betty$ is the passenger

Tom is the driver $\Leftrightarrow \neg Tom$ is the passenger

Tom drives Betty \Rightarrow Tom is the driver \land Betty is the passenger Betty drives $Tom \Rightarrow Betty$ is the driver $\land Tom$ is the passenger Tom drives Betty \lor Betty drives Tom

Sensible CarPool World Situations

The only 2 of the 64 in which all domain rules are True:

	Denotation	Denotation in Situation
Proposition	ဃ	4
Betty drives Tom	True	False
Tom drives Betty	False	True
Betty is the driver	True	False
Tom is the driver	False	True
Betty is the passenger	False	True
Tom is the passenger	True	False
Betty drives $Tom \Leftrightarrow \neg Tom is the driver$	True	True

General Effect of Domain Rules

the same) as the size of the set increases. The number of models that satisfy a set of wfps is reduced (or stays

satisfy Γ , then P is **independent** of Γ . satisfy $\Gamma \cup \{P\}$ is strictly less than the number of models that For a set of wfps, Γ , and a wfp P, if the number of models that

(Propositional Logic Version) The KRR Enterprise

Given a domain you are interested in reasoning about:

- the basic information of interest in the domain. 1. List the set of propositions (expressed in English) that captures
- show the English proposition as its intensional semantics. 2. Formalize the domain by creating one atomic wfp for each proposition listed in step (1). List the atomic wfps, and, for each,

The KRR Enterprise, Part 2

- all, but only, the situations of the domain that make sense satisfy 3. Using the atomic wfps, determine a set of domain rules so that independent. them. Strive for a set of domain rules that is small and
- 4. Optionally, formulate an additional set of situation-specific wfps interested in. We will call this restricted domain the "subdomain". that further restrict the domain to the set of situations you are
- 5. Letting Γ be the set of domain rules plus situation-specific wfps, subdomain if $\Gamma \models A$, is false in the subdomain if $\Gamma \models \neg A$, and subdomain, and False in others. otherwise is True in some more specific situations of the and A be any proposition you are interested in, A is True in the

                                                                                     do (return-from entails nil))
                                                                                                                          unless (denotation Q model)
                                                                                                                                                                 KB)
```

- 1. models does not really return all the satisfying models;
- 2. entails does extra work.

Tableau Methods Model-Finding Refutation

To Show $A_1, \ldots, A_n \models P$:

- Try to find a model that satisfies A_1, \ldots, A_n but falsifies P.
- If you succeed, $A_1, \ldots, A_n \not\models P$.
- If you fail, $A_1, \ldots, A_n \models P$.

methods" All refutation model-finding methods are commonly called "tableau

Semantic Tableaux and Wang's Algorithm are two tableau methods Propositional Logic. that are decision procedures for logical entailment in

Can stop as soon as one satisfying model has been found.

Wang's Algorithm^a

A Model-Finding Refutation Procedure

```
wang(Twfps, Fwfps) {
```

*

- * Twfps and Fwfps are sets of wfps.
- * Returns True if there is no model
- that satisfies Twfps and falsifies Fwfps;
- * Otherwise, returns False.

*

Note: is a version of models, but returns the opposite value.

Properties of Wang's Algorithm

1. Wang's Algorithm is **sound**:

If (wang A '(B)) = t then
$$A \models B$$

2. Wang's Algorithm is **complete**:

If
$$A \models B$$
 then (wang A '(B)) = t

3. Wang's Algorithm is a decision procedure: For any valid inputs A, B,

(wang A '(B)) terminates and returns t iff $A \models B$

Example: Tom's Evening Domain^a

appointment the next morning, then he works late. If Tom works watches a late movie or works late, then he stays up late. and needs his reference materials, then he works at his office. If late movie. If Tom needs to work and doesn't have an early appointment the next morning, then he stays home and watches a If there is a good movie on TV and Tom doesn't have an early Tom works late at his office, then he returns to his office. If Tom

and needs his reference materials Assume: Tom needs to work, doesn't have an early appointment,

Prove: Tom returns to his office and stays up late.

Proof Theory of the Standard Propositional Logic

Specifies when a given wfp can be derived correctly from a set of (other) wfps.

$$A_1,\ldots,A_n\vdash P$$

Determines what wfps are **theorems** of the logic.

$$\vdash P$$

• Depends on the notion of **proof**.

Hilbert-Style Syntactic Inference

- Set of Axioms.
- Small set of Rules of Inference.

Hilbert-Style Proof

- A **proof** of a theorem P is
- An ordered list of wfps ending with P
- Each wfp on the list is
- * Either an axiom
- * or follows from previous wfps in the list by one of the rules of inference.

Hilbert-Style Derivation

- A derivation of P from A_1, \ldots, A_n is
- A list of wfps ending with P
- Each wfp on the list is
- * Either an axiom * or some A_i
- * or follows from previous wfps in the list by one of the rules of inference.

Example Hilbert-Style Axioms^a

All instances of:

(A1).
$$(A \Rightarrow (B \Rightarrow A))$$

(A2).
$$((\mathcal{A} \Rightarrow (\mathcal{B} \Rightarrow \mathcal{C})) \Rightarrow ((\mathcal{A} \Rightarrow \mathcal{B}) \Rightarrow (\mathcal{A} \Rightarrow \mathcal{C})))$$

(A3).
$$((\neg \mathcal{B} \Rightarrow \neg \mathcal{A}) \Rightarrow ((\neg \mathcal{B} \Rightarrow \mathcal{A}) \Rightarrow \mathcal{B}))$$

Van Nostrand) 1964, pp. 31–32 ^aFrom Elliott Mendelson, Introduction to Mathematical Logic, (Princeton: D.

Implementing Natural Deduction

Heuristics:

try the introduction rule for the major connective. If trying to prove/derive a non-atomic wfp,

If trying to prove/derive a wfp, and that wfp is a component of a wfp, try the relevant elimination rule.

Using SNePS 3

```
wft1!: (if A A)
                                                                                  Since A can be derived after assuming A
                                  I infer wft1!: (if A A) by Implication Introduction.
                                                                                                                                                                      snuser(5): (askif '(if A A))

```

More Connections

- Deduction Theorem: $A \vdash P$ if and only if $\vdash A \Rightarrow P$.
- So proving theorems and deriving conclusions from assumptions are equivalent.
- But no atomic proposition is a theorem.
- So theorem proving makes more use of Introduction Rules than most AI reasoning systems.

Important Properties of Logical Systems

Soundness: $\vdash P \text{ implies} \models P$

Consistency: not both $\vdash P$ and $\vdash \neg P$

Completeness: $\models P \text{ implies} \vdash P$

More Connections

- If at most 1 of $\models P$ and $\models \neg P$ then soundness implies consistency.
- Soundness is the essence of "correct reasoning."
- Completeness less important for running systems since a proof may take too long to wait for.
- The Propositional Logics we have been looking at are complete.
- Gödel's Incompleteness Theorem: A logic strong enough to formalize arithmetic is *either* inconsistent *or* incomplete.

More Connections

$$A_1,\ldots,A_n\vdash P$$

$$\vdash A_1 \land \ldots \land A_n \Rightarrow P$$

soundness $\downarrow \uparrow \uparrow$ completeness

soundness $\psi \uparrow \uparrow$ completeness

$$A_1,\ldots,A_n\models P$$

$$\models A_1 \land \ldots \land A_n \Rightarrow P$$

2.5.1 Clause Form Syntax

Syntax of Atoms and Literals

Atomic Propositions:

- Any letter of the alphabet
- Any letter with a numerical subscript
- Any alphanumeric string.

Literals:

 $\neg P$ is called a **negative literal**. If P is an atomic proposition, P and $\neg P$ are literals. P is called a positive literal

Syntax of Clauses and Sets of Clauses Clause Form Syntax

Clauses: If $L_1, ..., L_n$ are literals then the set $\{L_1, ..., L_n\}$ is a clause.

Sets of Clauses: If C_1, \ldots, C_n are clauses then the set $\{C_1,\ldots,C_n\}$ is a set of clauses.

2.5.2 Clause Form Semantics

Atomic Propositions

Intensional: [P] is some proposition in the domain.

Extensional: [P] is either True or False.

Clause Form Semantics: Literals

Positive Literals: The meaning of P as a literal is the same as it is as an atomic proposition.

Negative Literals:

Intensional:

 $[\neg P]$ means that it is not the case that [P].

Extensional: $\llbracket \neg P \rrbracket$ is True if $\llbracket P \rrbracket$ is False;

Otherwise, it is False.

Clause Form Semantics: Clauses

Intensional:

$$[\{L_1,\ldots,L_n\}]=[L_1]$$
 and/or ... and/or $[L_n]$.

Extensional:

 $[[\{L_1,\ldots,L_n\}]]$ is True if at least one of $[[L_1]],\ldots,[[L_n]]$ is True; Otherwise, it is False.

Clause Form Semantics: Sets of Clauses

Intensional:

$$[\{C_1, ..., C_n\}] = [C_1] \text{ and } ... \text{ and } [C_n].$$

Extensional: $[\{C_1,\ldots,C_n\}]$ is True if $[C_1]$ and ... and $[C_n]$ are all True; Otherwise, it is False.

2.5.3 Clause Form Proof Theory: Resolution

Notion of Proof: None!

Notion of Derivation: A set of clauses constitutes a derivation.

Assumptions: The derivation is initialized with a set of assumption clauses A_1, \ldots, A_n .

Rule of Inference: A clause may be added to a set of clauses if justified by **resolution**.

Derived Clause: If clause Q has been added to a set of clauses or more applications of resolution then $A_1, \ldots, A_n \vdash Q$. initialized with the set of assumption clauses A_1, \ldots, A_n by one

Resolution

$$\{P, L_1, \dots, L_n\}, \{\neg P, L_{n+1}, \dots, L_m\}$$

 $\{L_1, \dots, L_n, L_{n+1}, \dots, L_m\}$

Resolution is sound, but not complete!

Example Derivation

```
5. {BettyIsThePassenger}
                                                                                                                                                \{\neg TomIsTheDriver, \neg TomIsThePassenger\}
                                                                                \{TomIsTheDriver\}
                                                                                                                \{TomIsThePassenger, BettyIsThePassenger\}
                                \{\neg TomIsThePassenger\}
R, 2, 4
                               R, 1, 3
                                                                                                                 Assumption
                                                                                                                                               Assumption
                                                                                   Assumption
```

Example of Incompleteness

$$\{P\} \models \{P,Q\}$$

but

$$\{P\} \not\vdash \{P,Q\}$$

because resolution does not apply to $\{P\}$.

2.5.4 Resolution Refutation

- Notice that $\{\{P\}, \{\neg P\}\}\$ is contradictory.
- Notice that resolution applies to $\{P\}$ and $\{\neg P\}$ producing {}, the empty clause.
- If a set of clauses is contradictory, repeated application of resolution is **guaranteed** to produce {}.

Implications

- Set of clauses $\{A_1, \ldots, A_n, Q\}$ is contradictory
- means $(A_1 \wedge ... \wedge A_n \wedge Q)$ is False in all models
- means whenever $(A_1 \wedge ... \wedge A_n)$ is True, Q is False
- means whenever $(A_1 \wedge ... \wedge A_n)$ is True $\neg Q$ is True
- means $A_1, \ldots, A_n \models \neg Q$.

Negation and Clauses

•
$$\neg \{L_1, \dots, L_n\} = \{\{\neg L_1\}, \dots, \{\neg L_n\}\}.$$

• $\neg L = \begin{cases} \neg A & \text{if } L = A \\ A & \text{if } L = \neg A \end{cases}$

Resolution Refutation

To decide if $A_1, \ldots, A_n \models Q$:

- 1. Let $S = \{A_1, ..., A_n\} \cup \neg Q$ (Note: $\neg Q$ is a set of clauses.)
- 2. Repeatedly apply resolution to clauses in S. (Determine if $\{A_1, \ldots, A_n\} \cup \neg Q \vdash \{\}$)
- 3. If generate $\{\}, A_1, \ldots, A_n \models Q$. (If $\{A_1, \ldots, A_n\} \cup \neg Q \vdash \{\}$ then $A_1, \ldots, A_n \models Q$)
- 4. If reach point where no new clause can be generated, but $\{\}$ has not appeared, $A_1, \ldots, A_n \not\models Q$. (If $\{A_1, \ldots, A_n\} \cup \neg Q \not\vdash \{\}$ then $A_1, \ldots, A_n \not\models Q$)

Example 1

To decide if $\{P\} \models \{P,Q\}$

$$S = \{ \{P\}, \{\neg P\}, \{\neg Q\} \}$$

 $1. \quad \{P\} \qquad Assumption$

2. $\{\neg P\}$ From query clause

3. $\{\}$ R, 1, 2

Example 2

To decide if

```
\{TomIsTheDriver\}
                                                                                                                                                                                                                                                                                                                                                                                                \{\neg TomIsTheDriver, \neg TomIsThePassenger\},
                                                                                                                                                                                                                                                                                                                                                              \{\,Tom Is The Passenger,\, Betty Is The Passenger\,\},
                                                                                                                                                                                                                                                                       \{\neg \textit{TomIsTheDriver}, \neg \textit{TomIsThePassenger}\}
                                                                                       \{TomIsThePassenger\}

                                                                                                                                                                                                                                                                                                                            \models \{BettyIsThePassenger\}
R, 3, 6
                                                                                     R, 2, 4
                                                                                                                                                                                                                            Assumption
                                                                                                                                                                                                                                                                         Assumption
                                           R, 1, 5
                                                                                                                                  From query clause
                                                                                                                                                                                Assumption
```

Resolution Efficiency Rules

Tautology Elimination: If clause C contains literals L and $\neg L$, delete C from the set of clauses. (Check throughout.)

Pure-Literal Elimination: If clause C contains a literal A $(\neg A)$ of clauses. (Check throughout.) and no clause contains a literal $\neg A$ (A), delete C from the set

Subsumption Elimination: If the set of clauses contains clauses clauses. (Check throughout.) C_1 and C_2 such that $C_1 \subseteq C_2$, delete C_2 from the set of

These rules delete unhelpful clauses.

Resolution Strategies

Unit Preference: Resolve shorter clauses before longer clauses.

Set of Support: One clause in each pair being resolved must descend from the query.

Many others

These are heuristics for finding {} faster.

Example 1 Using prover

```
cl-user(2): :ld /projects/shapiro/AIclass/prover
Fast loading /projects/shapiro/Alclass/prover.fasl
```

cl-user(3): :pa prover

```

Properties of Resolution Refutation

for Clause Form Propositional Logic. Resolution Refutation is sound, complete, and a decision procedure

Strategy are included. Elimination, Subsumption Elimination and the Unit-Preference It remains so when Tautology Elimination, Pure-Literal

assumptions are not contradictory. It remains so when Set of Support is used as long as the

2.5.5 Equivalence of Standard Propositional Logic and Clause FormLogic

Every set of clauses,

$$\{\{L_{1,1},\ldots,L_{1,n_1}\},\ldots,\{L_{m,1},\ldots,L_{m,n_m}\}\}$$

has the same semantics as the standard wfp

$$((L_{1,1} \vee \cdots \vee L_{1,n_1}) \wedge \cdots \wedge (L_{m,1} \vee \cdots \vee L_{m,n_m}))$$

well-formed proposition of standard propositional logic. That is, there is a translation from any set of clauses into a

of standard propositional logic into a set of clauses? Question: Is there a translation from any well-formed proposition

Answer: Yes!

Translating Standard Wfps into Clause Form

Conjunctive Normal Form (CNF)

literals A standard wfp is in CNF if it is a conjunction of disjunctions of

$$((L_{1,1} \vee \cdots \vee L_{1,n_1}) \wedge \cdots \wedge (L_{m,1} \vee \cdots \vee L_{m,n_m}))$$

Translation technique:

- 1. Turn any arbitrary wfp into CNF.
- 2. Translate the CNF wfp into a set of clauses.

Translating Standard Wfps The Subformula Property Useful Meta-Theorem: into Clause Form

If A is (an occurrence of) a subformula of B, and $\models A \Leftrightarrow C$,

then $\models B \Leftrightarrow B\{C/A\}$

Translating Standard Wfps into Clause Form Step 1

Eliminate occurrences of \Leftrightarrow using

$$\models (A \Leftrightarrow B) \Leftrightarrow ((A \Rightarrow B) \land (B \Rightarrow A))$$

From: $(LivingThing \Leftrightarrow (Animal \lor Vegetable))$

$$((LivingThing \Rightarrow (Animal \lor Vegetable))$$

$$\land ((Animal \lor Vegetable) \Rightarrow LivingThing))$$

Eliminate occurrences of \Rightarrow using

$$\models (A \Rightarrow B) \Leftrightarrow (\neg A \lor B)$$

From:

 $((LivingThing \Rightarrow (Animal \lor Vegetable))$

 $\land ((Animal \lor Vegetable) \Rightarrow LivingThing))$

10:

 $((\neg LivingThing \lor (Animal \lor Vegetable))$

 $\land (\neg (Animal \lor Vegetable) \lor LivingThing))$

Translate to miniscope form using

$$\models \neg (A \land B) \Leftrightarrow (\neg A \lor \neg B)$$

$$\models \neg (A \lor B) \Leftrightarrow (\neg A \land \neg B)$$

$$\models \neg (\neg A) \Leftrightarrow A$$

From:

$$((\neg LivingThing \lor (Animal \lor Vegetable))$$

 $\land (\neg (Animal \lor Vegetable) \lor LivingThing))$

$$((\neg LivingThing \lor (Animal \lor Vegetable))$$
$$\land ((\neg Animal \land \neg Vegetable) \lor LivingThing))$$

CNF: Translate into Conjunctive Normal Form, using

$$\models (A \lor (B \land C)) \Leftrightarrow ((A \lor B) \land (A \lor C))$$

$$\models ((B \land C) \lor A) \Leftrightarrow ((B \lor A) \land (C \lor A))$$

From:

 $((\neg LivingThing \lor (Animal \lor Vegetable))$

$$\land ((\neg Animal \land \neg Vegetable) \lor LivingThing))$$

$$((\neg LivingThing \lor (Animal \lor Vegetable))$$

$$\land ((\neg Animal \lor LivingThing) \land (\neg Vegetable \lor LivingThing)))$$

Discard extra parentheses using the associativity of \land and \lor .

From:

 $((\neg LivingThing \lor (Animal \lor Vegetable))$

 $\land ((\neg Animal \lor LivingThing) \land (\neg Vegetable \lor LivingThing)))$

 $((\neg LivingThing \lor Animal \lor Vegetable)$

 $\land (\neg Animal \lor LivingThing)$

 $\land (\neg Vegetable \lor LivingThing))$

and the conjunction into a set of clauses. Turn each disjunction into a clause,

From:

```
\land (\neg Vegetable \lor LivingThing))
                                                  \land (\neg Animal \lor LivingThing)
                                                                                                       ((\neg LivingThing \lor Animal \lor Vegetable)
```

```
\{\neg Vegetable, LivingThing\}\}
                                                                                    \{\{\neg LivingThing, Animal, Vegetable\},\
                                        \{\neg Animal, LivingThing\},\
```

Use of Translation

$$A_1, \ldots, A_n \models_{Standard} Q$$

The translation of
$$A_1 \wedge \cdots \wedge A_n \wedge \neg Q$$
 into a set of clauses $\vdash \{\}$

prover Example

```
prover(20): (prove '((iff LivingThing (or Animal Vegetable))
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       To prove
because it's subsumed by 1 (LivingThing)
                                           Deleting 4 ((not Vegetable) LivingThing)
                                                                                       because it's subsumed by 1 (LivingThing)
                                                                                                                                   Deleting
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             (LivingThing \Leftrightarrow Animal \lor Vegetable), (LivingThing \land \neg Animal) \models Vegetable
                                                                                                                                                                               ((not Vegetable)) From Query
                                                                                                                                                                                                                                                                                                                 ((not Animal) LivingThing) Assumption

3.1 CarPool World

Propositional Logic

Tom drives Betty Betty drives Tom

Tom is the driver Betty is the driver

 $Tom\ is\ the\ passenger\quad Betty\ i$

r Betty is the passenger

related only by the domain rules.

Predicate Logic

 $Drives(Tom, Betty) \quad Drives(Betty, Tom)$

Driver(Tom) Driver(Betty)

 $Passenger(Tom) \qquad Passenger(Betty)$

shows two properties, one relation, and two individuals

3.2 The "Standard"

_	Finite-Model Predicate Logic Syntax 176
•	1. Syntax
2.	2. Substitutions
ಬ	3. Semantics
4	4. Model Checking in Finite-Model Predicate Logic202

3.2.1 Syntax of the "Standard" Finite-Model Predicate Logic Atomic Symbols

Individual Constants:

- Any letter of the alphabet (preferably early),
- any (such) letter with a numeric subscript,
- any character string not containing blanks nor other punctuation marks.

For example: $a, B_{12}, Tom, Tom's_mother-in-law$.

Atomic Symbols, Part 2

Variables:

- Any letter of the alphabet (preferably late),
- any (such) letter with a numeric subscript.

For example: u, v_6 .

Atomic Symbols, Part 3

Predicate Symbols:

- Any letter of the alphabet (preferably late middle),
- any (such) letter with a numeric subscript,
- any character string not containing blanks.

For example: $P, Q_4, Drives$.

Each Predicate Symbol must have a particular arity.

Use superscript for explicit arity.

For example: P^1 , $Drives^2$, Q_2^3

Atomic Symbols, Part 4

In any specific predicate logic language

Individual Constants,

Variables,

Predicate Symbols

must be disjoint.

Set of individual constants and of predicate symbols must be **finite**.

Terms

- Every individual constant and variable is a term.
- Nothing else is a term.

Atomic Formulas

If P^n is a predicate symbol of arity n,

and t_1, \ldots, t_n are terms,

then $P^n(t_1,\ldots,t_n)$ is an atomic formula.

E.g.: $Passenger^{1}(Tom), Drives^{2}(Betty, y)$

(The superscript may be omitted if no confusion results.)

Well-Formed Formulas (wffs):

Every atomic formula is a wff.

If P is a wff, then so is $(\neg P)$.

If P and Q are wffs, then so are

$$(P \wedge Q) \quad (P \vee Q)$$

$$(P \Rightarrow Q) \quad (P \Leftrightarrow Q)$$

If P is a wff and x is a variable, then $\forall x(P)$ and $\exists x(P)$ are wffs.

confusion results. Parentheses may be omitted or replaced by square brackets if no

We will allow $(P_1 \wedge \cdots \wedge P_n)$ and $(P_1 \vee \cdots \vee P_n)$.

 $\forall x(\forall y(P))$ may be abbreviated as $\forall x, y(P)$.

 $\exists x (\exists y(P)) \text{ may be abbreviated as } \exists x, y(P).$

Quantifiers:

In $\forall xP$ and $\exists xP$

 \forall called the universal quantifier.

 \exists called the **existential quantifier**.

P is called the **scope** of quantification.

Free and Bound Variables

occurrence of $\forall x$ or $\exists x$, is said to be **free** in P and **bound** in $\forall xP$ and $\exists xP$. Every occurrence of x in P, not in the scope of some other

also free in $\forall xP$ and $\exists xP$. Every occurrence of every variable other than x that is free in P is

$$\forall x [P(x,y) \Leftrightarrow [(\exists x \exists z Q(x,y,z)) \Rightarrow R(x,y)]]$$

Open, Closed, and Ground

A wff with a free variable is called **open**.

A wff with no free variables is called **closed**,

An expression with no variables is called **ground**.

CarPool World Domain Rules

PropositionalLogic

Betty is the driver $\Leftrightarrow \neg Betty$ is the passenger

Tom is the driver $\Leftrightarrow \neg Tom$ is the passenger

Tom drives Betty \Rightarrow Tom is the driver \land Betty is the passenger Betty drives $Tom \Rightarrow Betty$ is the driver $\land Tom$ is the passenger

Tom drives Betty \lor Betty drives Tom

PredicateLogic

 $\forall x (Driver(x) \Leftrightarrow \neg Passenger(x))$

 $\forall x, y(Drives(x, y) \Rightarrow (Driver(x) \land Passenger(y)))$

 $Drives(Tom, Betty) \lor Drives(Betty, Tom)$

3.2.2 Substitutions Syntax

Pairs: t/v (Read : "t for v")

- t is any term
- v is any variable

Substitutions: $\{t_1/v_1,\ldots,t_n/v_n\}$

• $i \neq j \Rightarrow v_i \neq v_j$

Terminology

$$\sigma = \{t_1/v_1, \dots, t_n/v_n\}$$

 t_i is a **term** in σ

 v_i is a variable of σ

Say $t_i/v_i \in \sigma$ and $v_i \in \sigma$,

but not $t_i \in \sigma$

Note: x is not a variable of $\{x/y\}$,

i.e.
$$x/y \in \{x/y\}, y \in \{x/y\}, x \notin \{x/y\}$$

Substitution Application

For expression \mathcal{A} and substitution $\sigma = \{t_1/v_1, \dots, t_n/v_n\}$

 $\mathcal{A}\sigma$: replace every free occurrence of each v_i in \mathcal{A} by t_i

E So So

$$P(x,y)\{x/y,y/x\} = P(y,x)$$

$$\forall x [P(x,y) \Leftrightarrow [(\exists x \exists z Q(x,y,z)) \Rightarrow R(x,y,z)]] \{a/x,b/y,c/z\}$$

$$= \forall x [P(x,b) \Leftrightarrow [(\exists x \exists z Q(x,b,z)) \Rightarrow R(x,b,c)]]$$

Finite-Model Predicate Logic 3.2.3 Semantics of

Assumes a **Finite Domain**, \mathcal{D} , of

- individuals,
- sets of individuals,
- relations over individuals

Let \mathcal{I} be the set of all individuals in \mathcal{D} .

Semantics of Individual Constants

 $[a] = [a] = \text{some particular individual in } \mathcal{I}.$

There is no anonymous individual.

such that $[c] = \llbracket c \rrbracket = i$. I.e. for every individual, i in \mathcal{I} , there is an individual constant c

Semantics of Predicate Symbols

Predicate Symbols:

- $[P^1]$ is some category/property of individuals of \mathcal{I} .
- $[P^n]$ is some n-ary relation over \mathcal{I} .
- $\llbracket P^1 \rrbracket$ is some particular subset of \mathcal{I} .
- $\llbracket P^n \rrbracket$ is some particular subset of the relation

$$\underbrace{\mathcal{I} \times \cdots \times \mathcal{I}}_{n \text{ times}}.$$

of Ground Atomic Formulas Intensional Semantics

- If P^1 is some unary predicate symbol, category $[P^{I}]$ (or has the property $[P^{I}]$) then $[P^{1}(t)]$ is the proposition that [t] is an instance of the and t is some individual constant,
- If P^n is some n-ary predicate symbol, then $[P^n(t_1,\ldots,t_n)]$ is the proposition that the relation $[P^n]$ and t_1, \ldots, t_n are individual constants, holds among individuals $[t_1]$, and ..., and $[t_n]$.

of Ground Atomic Formulas Extensional Semantics

- If P^1 is some unary predicate symbol, and t is some individual constant, then $\llbracket P^1(t) \rrbracket$ is True if $\llbracket t \rrbracket \in \llbracket P^1 \rrbracket$, and False otherwise.
- If P^n is some n-ary predicate symbol, and t_1, \ldots, t_n are individual constants then $\llbracket P^n(t_1, \ldots, t_n) \rrbracket$ is True if $\langle \llbracket t_1 \rrbracket, \ldots, \llbracket t_n \rrbracket \rangle \in \llbracket P^n \rrbracket$, and False otherwise.

Semantics of WFFs, Part 1

 $[\neg P]$, $[P \land Q]$, $[P \lor Q]$, $[P \Rightarrow Q]$, $[P \Leftrightarrow Q]$ $[\neg P]$, $[P \land Q]$, $[P \lor Q]$, $[P \Rightarrow Q]$, and $[P \Leftrightarrow Q]$ are as they are in Propositional Logic.

Semantics of WFFs, Part 2

- $[\forall xP]$ is the proposition that every individual i in \mathcal{I} , with "name" t_i , satisfies $[P\{t_i/x\}]$.
- $[\exists xP]$ is the proposition that some individual i in \mathcal{I} , with "name" t_i , satisfies $[P\{t_i/x\}]$.
- $\llbracket \forall xP \rrbracket$ is True if $\llbracket P\{t/x\} \rrbracket$ is True for every individual constant, t. Otherwise, it is False.
- $[\exists xP]$ is True if there is some individual constant, t such that $[P\{t/x\}]$ is True. Otherwise, it is False.

Intensional Semantics of Individual Constants In CarPool World

[Tom] = Someone named Tom.[Betty] = Someone named Betty.

In 4-Person CarPool World (Call it 4pCarPool World) of Individual Constants Intensional Semantics

[Tom] = Someone named Tom.

[Betty] = Someone named Betty.

[John] = Someone named John.

[Mary] =Someone named Mary.

Intensional Semantics of Ground Atomic Wffs In Both CarPool Worlds

Predicate Symbols:

 $[Passenger^{1}(x)] = [x]$ is the passenger of the/a car. $[Driver^{1}(x)] = [x]$ is the driver of the/a car.

 $[Drives^{2}(x,y)] = [x] \text{ drives } [y] \text{ to work.}$

One CarPool World Situation **Extensional Semantics of**

```
[Tom] = Tom.
[Betty] = Betty.
[Driver] = \{Betty\}.
[Passenger] = \{Tom\}.
[Drives] = \{\langle Betty, Tom\rangle\}.
```

One 4pCarPool World Situation Extensional Semantics of

```
[Tom] = Tom.
[Betty] = Betty.
[John] = John.
[Mary] = Mary.
[Drives] = \{ \langle Betty, Tom \rangle, \langle John, Mary \rangle \}
                      [Passenger] = {Mary, Tom}.
                                                [Driver] = \{Betty, John\}.
```

in Finite-Model Predicate Logic 3.2.4 Model Checking

- n Individual Constants.
- Predicate P^j yields n^j ground atomic propositions.
- k_j predicates of arity j yields $\sum_j (k_j \times n^j)$ ground atomic propositions.
- So $2\sum_{j}(k_{j}\times n^{j})$ situations (columns of truth table).
- CarPool World has $2^{(2\times2^1+1\times2^2)}=2^8=256$ situations.
- 4pCarPool World has $2^{(2\times4^1+1\times4^2)} = 2^{24} = 16,777,216$ situations

Some CarPool World Situations

$\forall x \forall y (Drives(x, y) \Rightarrow (Driver(x) \Leftrightarrow Passenger(y)))$	$\forall x (Driver(x) \Leftrightarrow \neg Passenger(x))$	Drives(Betty, Betty)	Drives(Betty,Tom)	$Drives(\mathit{Tom},\mathit{Betty})$	$Drives(\mathit{Tom},\mathit{Tom})$	Passenger(Betty)	$Passenger(\mathit{Tom})$	Driver(Betty)	$Driver(\mathit{Tom})$
	\overline{F}	T	T	T	T	T	T	T	T
T	T	F	F	T	F	T	F	F	T
T	T	T F F	T	F	F	F	T	T	F

Turning

Predicate Logic Over Finite Domains Into Ground Predicate Logic

If c_1, \ldots, c_n are the individual constants,

- Turn $\forall x P(x)$ into $P(c_1) \land \cdots \land P(c_n)$
- and $\exists x P(x)$ into $P(c_1) \lor \cdots \lor P(c_n)$
- H.g.:

$$\forall x \exists y (Drives(x, y))$$

$$\Leftrightarrow \exists y Drives(Tom, y) \land \exists y Drives(Betty, y)$$

$$\Leftrightarrow (Drives(Tom, Tom) \lor Drives(Tom, Betty))$$

$$\land (Drives(Betty, Tom) \lor Drives(Betty, Betty))$$

Sorted Logic: A Digression

Introduce a hierarchy of sorts, s_1, \ldots, s_n .

(A sort in logic is similar to a data type in programming.)

Assign each individual constant a sort.

Assign each variable a sort.

symbol. Declare the sort of each argument position of each predicate

sort of t_i , for each i, is the sort, or a subsort of the sort, declared for the i^{th} argument position of P^n . An atomic formula, $P^n(t_1,\ldots,t_n)$ is only syntactically valid if the

Predicate 2-Car CarPool World in Decreasoner

```
predicate DrivesIn(commuter,commuter,car)
predicate PassengerIn(commuter,car)
                                               ;;; [PassengerIn(x,c)] = [x] is a passenger in car [c].
                                                                                                                                                    predicate DriverOf(commuter,car)
                                                                                                                                                                                                   ;;; [DriverOf(x,c)] = [x] is the driver of car [c].
                                                                                                                                                                                                                                                                                                                                                    ;;; [DrivesIn(x,y,c)] = [x] drives [y] to work in car [c].
                                                                                                                                                                                                                                                                                                                                                                                                                                                            car TomsCar, BettysCar
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                sort car
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          commuter Tom, Betty
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  sort commuter

Finite-Model Predicate Logic 3.3.1 Syntax of Clause Form

formulas as in standard finite-model predicate logic. Individual constants, predicate symbols, terms, and ground atomic

(Variables are not needed.)

Literals, clauses and sets of clauses as in propositional clause form

3.3.2 Semantics of Clause Form Finite-Model Predicate Logic

- Individual constants, predicate symbols, terms, and ground atomic formulas as in standard finite-model predicate logic.
- Ground literals, ground clauses, and sets of ground clauses as in propositional clause form logic.

Finite-Model Predicate Calculus Translation of Standard Form to Clause Form

- 1. Eliminate quantifiers as when using model checking.
- 2. Translate into clause form as for propositional logic

3.3.3 Model Finding: GSAT

procedure GSAT(C, tries, flips)

output: a model satisfying C, or failure **input:** a set of clauses C, and positive integers tries and flips

for i := 1 to tries do

 $\mathcal{M}:=$ a randomly generated truth assignment

for j := 1 to flips do

if $\mathcal{M} = C$ then return \mathcal{M}

p := an atom such that a change in its truth assignment gives the largest increase in the total

number of clauses in C that are satisfied by \mathcal{M}

 $\mathcal{M} := \mathcal{M}$ with the truth assignment of p reversed

end for end for

return "no satisfying interpretation found"

A New Method for Solving Hard Satisfiability Problems, AAAI-92.] [Brachman & Levesque, p. 82–83, based on Bart Selman, Hector J. Levesque and David Mitchell,

A Pedagogical Implementation of GSAT

/projects/shapiro/CSE563/gsat.cl

Uses wang: expand to eliminate quantifiers,

and prover:clauseForm to translate to clause form.

Example GSAT Run

```
gsat(3): (gsat '((forall x (iff (Driver x) (not (Passenger x))))
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       cl-user(2): :pa gsat

Model Finding: Decreasoner

into DIMACS clause form. Decreasoner translates sorted finite-model predicate logic wffs

Decreasoner gives set of clauses to Relsat.

Relsat systematically searches all models. It either:

returns up to MAXMODELS (currently 100) satisfying models; reports that there are no satisfying models; or gives up.

If Relsat gives up, Decreasoner gives set of clauses to Walksat.

returns some satisfying models; or returns some "near misses"; or gives up.

Decreasoner, Walksat, and "Near Misses"

command-line option: assignment that satisfies all but N clauses of the problem. Walksat provides the "Let's say that an "N-near miss model of a SAT problem" is a truth

-target N = succeed if N or fewer clauses unsatisfied

In my experience, three or more unsatisfied clauses are less useful. fails, it gives up. One or two unsatisfied clauses may be helpful for debugging. walksat with -target 1. If this fails, it invokes walksat with -target 2. If this If relsat produces no models, the Discrete Event Calculus Reasoner invokes

previous one." near miss model, and that near miss model may be more informative than the If you get a near miss model, it's often useful to rerun the Discrete Event Calculus Reasoner. Because walksat is stochastic, you may get back a different

4.2.1 Syntax of the "Standard" First-Order Predicate Logic Atomic Symbols

Individual Constants:

- Any letter of the alphabet (preferably early),
- any (such) letter with a numeric subscript,
- any character string not containing blanks nor other punctuation marks.

For example: $a, B_{12}, Tom, Tom's_mother-in-law$.

Arbitrary Individuals:

- Any letter of the alphabet (preferably early),
- any (such) letter with a numeric subscript.

Indefinite Individuals:

- Any letter of the alphabet (preferably early),
- any (such) letter with a numeric subscript.

Variables:

- Any letter of the alphabet (preferably late),
- any (such) letter with a numeric subscript.

For example: x, y_6 .

Function Symbols:

- Any letter of the alphabet (preferably early middle)
- any (such) letter with a numeric subscript
- any character string not containing blanks.

For example: $f, g_2, mother Of, family Of$.

Predicate Symbols:

- Any letter of the alphabet (preferably late middle),
- any (such) letter with a numeric subscript,
- any character string not containing blanks.

For example: $P, Q_4, Passenger, Drives$.

particular arity. Each Function Symbol and Predicate Symbol must have a

Use superscript for explicit arity.

For example: $mother Of^{1}$, $Drives^{2}$, $family Of^{2}$, g_{2}^{3}

In any specific predicate logic language

Individual Constants,
Arbitrary Individuals,
Indefinite Individuals,
Variables,
Function Symbols,
Predicate Symbols

must be disjoint.

Terms

- Every individual constant, every arbitrary individual, every indefinite individual, and every variable is a term.
- If f^n is a function symbol of arity n, and t_1, \ldots, t_n are terms, then $f^n(t_1,\ldots,t_n)$ is a term. (The superscript may be omitted if no confusion results.)
- Nothing else is a term.

For example: $familyOf^{2}(Tom, motherOf^{1}(Betty))$

Atomic Formulas

If P^n is a predicate symbol of arity n,

and t_1, \ldots, t_n are terms,

then $P^n(t_1,\ldots,t_n)$ is an atomic formula.

E.g.: $ChildIn^{2}(Betty, familyOf^{2}(Tom, motherOf^{1}(Betty)))$

(The superscript may be omitted if no confusion results.)

Well-Formed Formulas (wffs):

- Every atomic formula is a wff.
- If P is a wff, then so is $\neg(P)$.
- If P and Q are wffs, then so are

$$(P \wedge Q) \quad (P \vee Q)$$

$$(P \Rightarrow Q) \quad (P \Leftrightarrow Q)$$

If P is a wff and x is a variable, then $\forall x(P)$ and $\exists x(P)$ are wffs. no confusion results. Parentheses may be omitted or replaced by square brackets if

We will allow $(P_1 \wedge \cdots \wedge P_n)$ and $(P_1 \vee \cdots \vee P_n)$.

 $\forall x(\forall y(P)) \text{ may be abbreviated as } \forall x, y(P).$

 $\exists x (\exists y(P)) \text{ may be abbreviated as } \exists x, y(P).$

Open, Closed, Ground, and Free For

A wff with a free variable is called **open**.

A wff with no free variables is called **closed**.

An expression with no variables is called **ground**.

Note: expressions now include functional terms

of any quantifier $\forall y$ or $\exists y$ whose variable y is in t. Remedy: rename y in A(x). E.g., $\forall u \exists v (A(x, u) \lor B(x, v))$ but f(a, y, b) is not free for x in $\forall u \exists y (A(x, u) \lor B(x, y))$. E.g., f(a, y, b) is free for x in $\forall u \exists v (A(x, u) \lor B(x, v))$ no free occurrence of x in A(x) is in the scope A term t is **free for** a variable x in the wff A(x) if

Substitutions with Functional Terms

Notice, terms may now include functional terms.

H.g.:

$$P(x, f(y), z) \{a/x, g(b)/y, f(a)/z\} = P(a, f(g(b)), f(a))$$

4.2.2 Semantics of the "Standard" First-Order Predicate Logic

Assumes a **Domain**, \mathcal{D} , of

- individuals,
- functions on individuals,
- sets of individuals,
- relations on individuals

Let \mathcal{I} be set of all individuals in \mathcal{D} .

Semantics of Constants

Individual Constant:

 $[a] = [a] = \text{some particular individual in } \mathcal{I}.$

Arbitrary Individual:

[a] = [a] = a representative of all individuals in \mathcal{I} . Everything True about all of them, is True of it.

Indefinite Individual:

unspecified which one [s] = [s] = a representative of some individual in \mathcal{I} , but it's

There is no anonymous individual.

[t] = i. (But not necessarily an individual constant.) I.e. for every individual, i in \mathcal{I} , there is a ground term t such that

Intensional Semantics of Functional Terms

Function Symbols: $[f^n]$ is some n-ary function in \mathcal{D} ,

Functional Terms:

is the value of $[f^n]$ on $[t_1]$, and ..., and $[t_n]$. then $[f^n(t_1,\ldots,t_n)]$ is a description of the individual in \mathcal{I} that If f^n is some function symbol and t_1, \ldots, t_n are ground terms,

Extensional Semantics of Functional Terms

Function Symbols: $[f^n]$ is some function in \mathcal{D} ,

$$\llbracket f^n \rrbracket \colon \underbrace{\mathcal{I} \times \cdots \times \mathcal{I}}_{n \text{ times}} \to \mathcal{I}$$

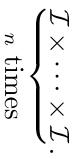

Functional Terms:

If f^n is some function symbol and t_1, \ldots, t_n are ground terms, then $[f^n(t_1,\ldots,t_n)] = [f^n]([t_1],\ldots,[t_n]).$

Semantics of Predicate Symbols

Predicate Symbols:

- $[P^1]$ is some category/property of individuals of \mathcal{I}
- $[P^n]$ is some n-ary relation in \mathcal{D} .
- $\llbracket P^1 \rrbracket$ is some particular subset of \mathcal{I} .
- $\llbracket P^n \rrbracket$ is some particular subset of the relation

of Ground Atomic Formulas Intensional Semantics

- If P^1 is some unary predicate symbol, category $[P^1]$ (or has the property $[P^1]$). then $[P^{1}(t)]$ is the proposition that [t] is an instance of the and t is some ground term,
- If P^n is some n-ary predicate symbol, then $[P^n(t_1,\ldots,t_n)]$ is the proposition that the relation $[P^n]$ and t_1, \ldots, t_n are ground terms, holds among individuals $[t_1]$, and ..., and $[t_n]$.

of Ground Atomic Formulas Extensional Semantics

Atomic Formulas:

- If P^1 is some unary predicate symbol, and t is some ground term, then $\llbracket P^1(t) \rrbracket$ is True if $\llbracket t \rrbracket \in \llbracket P^1 \rrbracket$, and False otherwise.
- If P^n is some n-ary predicate symbol, and t_1, \ldots, t_n are ground terms, then $\llbracket P^n(t_1, \ldots, t_n) \rrbracket$ is True if $\langle \llbracket t_1 \rrbracket, \ldots, \llbracket t_n \rrbracket \rangle \in \llbracket P^n \rrbracket$, and False otherwise.

Semantics of WFFs, Part 1

 $[\neg P]$, $[P \land Q]$, $[P \lor Q]$, $[P \Rightarrow Q]$, $[P \Leftrightarrow Q]$ $[\neg P]$, $[P \land Q]$, $[P \lor Q]$, $[P \Rightarrow Q]$, and $[P \Leftrightarrow Q]$ are as they are in Propositional Logic.

Semantics of WFFs, Part 2

- $[\forall xP]$ is the proposition that every individual i in \mathcal{I} , with name or description t_i , satisfies $[P\{t_i/x\}]$.
- $[\exists xP]$ is the proposition that some individual i in \mathcal{I} , with name or description t_i , satisfies $[P\{t_i/x\}]$.
- $\llbracket \forall x P \rrbracket$ is True if $\llbracket P\{t/x\} \rrbracket$ is True for every ground term, t. Otherwise, it is False
- $[\exists xP]$ is True if there is some ground term, t such that $[P\{t/x\}]$ is True. Otherwise, it is False.

of a 2-Car CarPool World 1 Intensional Semantics

Individual Constants:

[Tom] =The individual named Tom.

[Betty] =The individual named Betty.

Functions:

[mother Of(x)] =The mother of [x].

of a 2-Car CarPool World 2 Intensional Semantics

Predicates:

 $[Driver^{1}(x)] = [x]$ is the driver of a car.

 $[Passenger^{1}(x)] = [x]$ is the passenger in a car.

 $[Drives^{2}(x, y)] = [x] \text{ drives } [y] \text{ in a car.}$

a 2-Car CarPool World Situation Extensional Semantics of

```
 [\![Passenger]\!] = \{ [\![Betty]\!], [\![Tom]\!] \}.   [\![Drives]\!] = \{ \langle [\![motherOf(Betty)]\!], [\![Betty]\!] \rangle, 
                                                                                                                                                                                          [\![Driver]\!] = \{[\![motherOf(Betty)]\!], [\![motherOf(Tom)]\!]\}.
                                                                                                                                                                                                                                                                                                                  [[mother Of]] = \{ \langle [[Betty]], [[mother Of(Betty)]] \rangle, \}
                                                                                                                                                                                                                                                                                                                                                                                     [Betty] = the individual named Betty.
                                                                                                                                                                                                                                                                                                                                                                                                                                                       [Tom] = the individual named Tom.
\langle [motherOf(Tom)], [Tom] \rangle \}.
                                                                                                                                                                                                                                                          \langle [Tom], [motherOf(Tom)] \rangle \}.
```

4.2.3 Model Checking in Full FOL

n Individual Constants.

At least one function yields ∞ terms.* Decreasoner.

motherOf(motherOf(motherOf(Tom))).... $E.g.,\ mother Of(Tom), mother Of(mother Of(Tom)),$

So ∞ ground atomic propositions.

So ∞ situations (columns of truth table).

So can't create entire truth table.

Can't do model checking

by expanding quantified expressions

into Boolean combination of ground wffs.

has an ∞ number of terms describing it, but we'll assume not There still could be a finite domain if at least one individual in $\mathcal I$

4.2.4 Hilbert-Style Proof Theory for First-Order Predicate Logic

(A1).
$$(A \Rightarrow (B \Rightarrow A))$$

$$\textbf{(A2).} \ ((\mathcal{A} \Rightarrow (\mathcal{B} \Rightarrow \mathcal{C})) \Rightarrow ((\mathcal{A} \Rightarrow \mathcal{B}) \Rightarrow (\mathcal{A} \Rightarrow \mathcal{C})))$$

(A3).
$$((\neg \mathcal{B} \Rightarrow \neg \mathcal{A}) \Rightarrow ((\neg \mathcal{B} \Rightarrow \mathcal{A}) \Rightarrow \mathcal{B}))$$

(A4).
$$\forall x \mathcal{A} \Rightarrow \mathcal{A}\{t/x\}$$

where t is any term free for x in $A(x)$.

(A5).
$$(\forall x(A \Rightarrow B)) \Rightarrow (A \Rightarrow \forall xB)$$

if \mathcal{A} is a wff containing no free occurrences of x.

"Standard" First-Order Predicate Logic Hilbert-Style Rules of Inference for

$$\mathcal{A},\mathcal{A}\Rightarrow\mathcal{B}$$
 \mathcal{B}

$$\forall x \mathcal{A}$$

Note: $\exists x \mathcal{A}$ is just an abbreviation of $\neg \forall x \neg \mathcal{A}$.

Additional Rules of Inference for \forall for First-Order Predicate Logic 4.2.5 Fitch-Style Proof Theory

4.3 Clause-Form First-Order Predicate

	Logic	
<u>. </u>	1. Syntax 261	
2	2. Semantics	\sim
ယ	3. Proof Theory270	
	4. Resolution Refutation	r –

4.3.1 Syntax of Clause-Form First-Order Atomic Symbols Predicate Logic

Individual Constants:

- Any letter of the alphabet (preferably early),
- any (such) letter with a numeric subscript,
- any character string not containing blanks nor other punctuation marks.

For example: $a, B_{12}, Tom, Tom's_mother-in-law$.

Skolem Constants: Look like individual constants.

Atomic Symbols, Part 2

Variables:

- Any letter of the alphabet (preferably late),
- any (such) letter with a numeric subscript.

For example: u, v_6 .

Atomic Symbols, Part 3

Function Symbols:

- Any letter of the alphabet (preferably early middle)
- any (such) letter with a numeric subscript
- any character string not containing blanks.

For example: f, g_2 .

Use superscript for explicit arity.

Skolem Function Symbols: Look like function symbols

Atomic Symbols, Part 4

Predicate Symbols:

- Any letter of the alphabet (preferably late middle),
- any (such) letter with a numeric subscript,
- any character string not containing blanks.

For example: P, Q_4, odd .

Use superscript for explicit arity.

Terms

- Every individual constant, every Skolem constant, and every variable is a term.
- If f^n is a function symbol or Skolem function symbol of arity n, and t_1, \ldots, t_n are terms, then $f^n(t_1,\ldots,t_n)$ is a term.
- Nothing else is a term.

(The superscript may be omitted if no confusion results.)

Atomic Formulas

If P^n is a predicate symbol of arity n,

and t_1, \ldots, t_n are terms,

then $P^n(t_1,\ldots,t_n)$ is an atomic formula.

(The superscript may be omitted if no confusion results.)

Literals and Clauses

Literals: If P is an atomic formula, then P and $\neg P$ are literals.

Clauses: If $L_1, ..., L_n$ are literals, then the set $\{L_1, ..., L_n\}$ is a clause.

Sets of Clauses: If C_1, \ldots, C_n are clauses, then the set $\{C_1, \ldots, C_n\}$ is a set of clauses.

4.3.2 Semantics of Clause-Form First-Order Predicate Logic

- Individual Constants, Function Symbols, Predicate Symbols, Ground Terms, and Ground Atomic Formulas as for Standard
- Skolem Constants are like indefinite individuals
- Skolem Function Symbols are like indefinite function symbols.
- Ground Literals, Ground Clauses, and Sets of Clauses as for Clause-Form Propositional Logic.

Semantics of Open Clauses

If clause C contains variables v_1, \ldots, v_n ,

no more variables. then $C\{t_1/v_1,\ldots,t_n/v_n\}$ is a **ground instance** of C if it contains

If C is an open clause,

 $[\![C]\!]$ is True if every ground instance of C is True.

Otherwise, it is False.

with scope being the clause That is, variables take on universal interpretation,

4.3.3 Proof Theory of Clause-Form FOL

Notion of Proof: None!

Notion of Derivation: A set of clauses constitutes a derivation.

Assumptions: The derivation is initialized with a set of assumption clauses A_1, \ldots, A_n .

Rule of Inference: A clause may be added to a set of clauses if justified by a rule of inference

Derived Clause: If clause Q has been added to a set of clauses or more applications of resolution, initialized with the set of assumption clauses A_1, \ldots, A_n by one then $A_1, \ldots, A_n \vdash Q$.

Clause-Form FOL Rules of Inference Version 1

Resolution:
$$\frac{\{P, L_1, \dots, L_n\}, \{\neg P, L_{n+1}, \dots, L_m\}}{\{L_1, \dots, L_n, L_{n+1}, \dots, L_m\}}$$

Universal Instantion (temporary): ——

$$[\neg P(a), L_{n+1}(a), \dots, L_m(a)]$$

$$\{L_1(a),\ldots,L_n(a),L_{n+1}(a),\ldots,L_m(a)\}$$

Most General Unifier

is a substitution, μ , A most general unifier (**mgu**), of atomic formulas \mathcal{A} and \mathcal{B}

such that $\mathcal{A}\mu = \mathcal{B}\mu = a$ common instance of \mathcal{A} and \mathcal{B}

instance of it. and such that every other common instance of \mathcal{A} and \mathcal{B} is an

I.e., $A\mu = B\mu = a$ most general common instance of A and B.

Example:

giving P(a, b, c)Unifier of P(a, x, y) and P(u, b, v) is $\{a/u, b/x, c/y, c/v\}$

But more general is $\{a/u, b/x, y/v\}$ giving P(a, b, y)

Clause-Form FOL Rules of Inference Version 2

$${A, L_1, \dots, L_n}, {\neg B, L_{n+1}, \dots, L_m}$$

Resolution:

$$\{L_1\mu,\ldots,L_n\mu,L_{n+1}\mu,\ldots,L_m\mu\}$$

where μ is an mgu of A and B.

Assume two parent clauses have no variables in common.

Example Derivation Revisited

```
{\neg Drives(x,y), Driver(x)}
    Assumption
```

2.
$$\{\neg Driver(z), \neg Passenger(z)\}$$
 Assum

$$Assumption \\$$

5.
$$\{\neg Passenger(motherOf(Tom))\}$$
 R,

$$R, 2, 4, \{motherOf(Tom)/z, \}$$

Unification

To find the mgu of \mathcal{A} and \mathcal{B} .

Some Examples:

P(x, f(x))	P(a,x)	P(a,x)	P(a)	P(a,b)	4
P(y,y)	P(y,g(y))	P(y,b)	P(b)	P(a,b)	\mathcal{B}
$\Big \; FAIL \; \; \; (occurs \; check)$	$\left \{a/y, g(a)/x\} \right $	$\left \ \{a/y,b/x\} \right $	FAIL	{}	mgu
	P(a,g(a))	P(a,b)		P(a,b)	mgci

Substitution Composition

$$P\sigma\tau = ((P\sigma)\tau) = P(\sigma \circ \tau)$$
Let $\sigma = \{t_1/v_1, \dots, t_n/v_n\}$

$$\sigma \circ \tau = \{t_1\tau/v_1, \dots, t_n\tau/v_n\} \uplus \tau$$

$$\sigma \uplus \tau = \sigma \cup \{t/v \mid (t/v \in \tau) \land v \notin \sigma\}$$
E.g.: $\{x/y, y/z\} \circ \{u/y, v/w\} = \{x/y, u/z, v/w\}$

```
\mu = \{\}
                   (P \times (g \times) (g (f a)))
                       (P (f u) v v)

```

Resolution Refutation is Incomplete for FOL

1.
$$\{P(u), P(v)\}$$

2.
$$\{\neg P(x), \neg P(y)\}$$

3.
$$\{P(w), \neg P(z)\}\ R, 1, 2, \{u/x, w/v, z/y\}$$

Clause-Form FOL Rules of Inference Version 3 (Last)

Resolution:
$$\{A, L_1, ..., L_n\}, \{\neg B, L_{n+1}, ..., L_m\}$$

 $\{L_1\mu, ..., L_n\mu, L_{n+1}\mu, ..., L_m\mu\}$

where μ is an mgu of A and B.

where μ is an mgu of A and B.

(Note: Special case of UI.)

Resolution Refutation with Factoring is Complete

If
$$A_1, \ldots, A_n \models Q$$
, then $A_1, \ldots, A_n, \neg Q \vdash_{R+F} \{\}$.

For example,

1.
$$\{P(u), P(v)\}$$

2.
$$\{\neg P(x), \neg P(y)\}$$

4.
$$\{\neg P(z)\}$$
 $F, 2,$

$$F, 1, \{w/u, w/v\}$$

4.
$$\{\neg P(z)\}$$

 $\{P(w)\}$

$$F,2,\{z/x,z/y\}$$

$$R,3,4,\{w/z\}$$

procedure—it is a semi-decision procedure However, resolution refutation with factoring is still not a decision

2008]a?x) (p?y b)) gets factored, but not condensed. [Mark Stickel, personal communication, March, subsumption elimination when the factored clause subsumes the original clause. The clause '(or (p SNARK has both factoring and condensing, which is factoring combined with immediate

Efficiency Rules

Tautology Elimination: If clause C contains literals L and $\neg L$, delete C from the set of clauses. (Check throughout.)

Pure-Literal Elimination: If clause C contains a literal A $(\neg A)$ and no clause contains a literal $\neg B$ (B) such that A and B are unifiable, delete C from the set of clauses. (Check throughout.)

Subsumption Elimination: If the set of clauses contains clauses $C_1\sigma\subseteq C_2$, delete C_2 from the set of clauses. (Check C_1 and C_2 such that there is a substitution σ for which throughout.)

These rules delete unhelpful clauses.

Subsumption may be required to cut infinite loops.

```

Strategies

Unit Preference: Resolve shorter clauses before longer clauses. Least Symbol Count Version: Count symbols, not literals

Set of Support: One clause in each pair being resolved must descend from the query.

Many others

These are heuristics for finding {} faster.

Least Symbol Count Version of Unit Preference

Instead of counting literals,

count symbols

ignoring negation operator.

Equivalent to standard unit preference for Propositional Logic.

Problem with

Literal-Counting Unit Preference

4.4 Translating Standard FOL Wffs into FOL Clause Form

Useful Meta-Theorems

If A is (an occurrence of) a subformula of B, then $\models B \Leftrightarrow B\{C/A\}$ and $\models A \Leftrightarrow C$,

 $\forall x_1(\cdots \forall x_n(\cdots \exists y A(x_1, \ldots, x_n, y) \cdots) \cdots) \text{ is consistent}$ if and only if

is consistent, $\forall x_1(\cdots \forall x_n(\cdots A(x_1,\ldots,x_n,f^n(x_1,\ldots,x_n))\cdots)\cdots)$

where f^n is a new Skolem function.

Note: use a new Skolem constant instead of $f^0()$.

Translating Standard FOL Wffs into FOL Clause Form

Step 1

Eliminate occurrences of \Leftrightarrow using

$$\models (A \Leftrightarrow B) \Leftrightarrow ((A \Rightarrow B) \land (B \Rightarrow A))$$

$$\forall x [Parent(x) \Leftrightarrow (Person(x) \land \exists y (Person(y) \land childOf(y, x)))]$$

$$\forall x[(Parent(x) \Rightarrow (Person(x) \land \exists y(Person(y) \land childOf(y, x)))) \\ \land ((Person(x) \land \exists y(Person(y) \land childOf(y, x))) \Rightarrow Parent(x))]$$

Eliminate occurrences of \Rightarrow using

$$\models (A \Rightarrow B) \Leftrightarrow (\neg A \lor B)$$

Hrom:

$$\forall x [(Parent(x) \Rightarrow (Person(x) \land \exists y (Person(y) \land childOf(y, x)))) \land ((Person(x) \land \exists y (Person(y) \land childOf(y, x)))) \Rightarrow Parent(x))]$$

$$\forall x [(\neg Parent(x) \lor (Person(x) \land \exists y (Person(y) \land childOf(y, x)))) \\ \land (\neg (Person(x) \land \exists y (Person(y) \land childOf(y, x))) \lor Parent(x))]$$

Translate to miniscope form using

$$\models \neg \neg A \Leftrightarrow A$$

$$\models \neg (A \land B) \Leftrightarrow (\neg A \lor \neg B) \quad \models \neg (A \lor B) \Leftrightarrow (\neg A \land \neg B)$$

$$\models \neg \forall x A(x) \Leftrightarrow \exists x \neg A(x) \quad \models \neg \exists x A(x) \Leftrightarrow \forall x \neg A(x)$$

$$\forall x[(\neg Parent(x) \lor (Person(x) \land \exists y(Person(y) \land childOf(y,x)))) \land (\neg (Person(x) \land \exists y(Person(y) \land childOf(y,x))) \lor Parent(x))]$$
 To:

$$\forall x [(\neg Parent(x) \lor (Person(x) \land \exists y (Person(y) \land childOf(y, x)))) \\ \land ((\neg Person(x) \lor \forall y (\neg Person(y) \lor \neg childOf(y, x))) \lor Parent(x))]$$

variable, rename all occurrences of one of them. Rename apart: If any two quantifiers bind the same

$$\forall x [(\neg Parent(x) \lor (Person(x) \land \exists y (Person(y) \land childOf(y, x)))) \land ((\neg Person(x) \lor \forall y (\neg Person(y) \lor \neg childOf(y, x))) \lor Parent(x))]$$
 To:

$$\forall x [(\neg Parent(x) \lor (Person(x) \land \exists y (Person(y) \land childOf(y, x)))) \land ((\neg Person(x) \lor \forall z (\neg Person(z) \lor \neg childOf(z, x))) \lor Parent(x))]$$

Optional Translation Step 4.5

Translate into Prenex Normal Form using:

4.5 Asking Wh Questions

Given

$$\forall x [Parent(x) \Leftrightarrow (Person(x) \land \exists y (Person(y) \land childOf(y, x)))]$$

Person(Tom)

Person(Betty)

childOf(Tom,Betty)

Ask: "Who is a parent?"

Answer via constructive proof of $\exists x \ Parent(x)$.

Try to Answer Wh Question

QED

The Answer Predicate

Instead of query $\exists x_1 \cdots \exists x_n P(x_1, \ldots, x_n)$,

and resolution refutation with $\{\neg P(x_1,\ldots,x_n)\}$

until {},

use $\forall x_1 \cdots \forall x_n (P(x_1, \dots, x_n) \Rightarrow Answer(P(x_1, \dots, x_n)))$

and do direct resolution with

$$\{\neg P(x_1,\ldots,x_n), Answer(P(x_1,\ldots,x_n))\}$$

until $\{(Answer...)\cdots(Answer...)\}.$

Inserting The Answer Predicate General Procedure for

Let:

Q be either \forall or \exists ;

 \overline{Q} be either \exists or \forall , respectively;

Prenex Normal form of query be $Q_1x_1 \cdots Q_nx_nP(x_1,\ldots,x_n)$.

Do direct resolution with clause form of

$$\overline{Q_1}x_1\cdots\overline{Q_n}x_n(P(x_1,\ldots,x_n)\Rightarrow Answer(P(x_1,\ldots,x_n)))$$

until generate $\{(Answer...)\cdots(Answer...)\}.$

Using the Answer Predicate

```

Rule-Based Systems

Every FOL KB

can be expressed as a set of rules of the form

$$\forall \overline{x}(C_1(\overline{x}) \lor \cdots \lor C_m(\overline{x}))$$

 $\frac{1}{2}$

$$\forall \overline{x}(A_1(\overline{x}) \land \dots \land A_n(\overline{x}) \Rightarrow C_1(\overline{x}) \lor \dots \lor C_m(\overline{x}))$$

 \supseteq

$$\forall \overline{x}(A_1(\overline{x}) \land \dots \land A_n(\overline{x}) \Rightarrow C(\overline{x}))$$

where $A_i(\overline{x})$ and $C_j(\overline{x})$ are literals.

Wh Questions in Rule-Based Systems

Given rule $\forall \overline{x}(A(\overline{x}) \Rightarrow C(\overline{x}))$

Ask $C(\overline{y})$?

Backchain to subgoal $A(\overline{x})\mu$, where μ is an mgu of $C(\overline{x})$ and $C(\overline{y})$

systems Moral: Unification is generally needed in backward chaining

variables. Unification is correct pattern matching when both structures have

Forward Chaining & Unification

antecedents. Forward chaining generally matches a ground fact with rule

Forward chaining does not generally require unification.

Common Formalizing Difficulties

Every raven is black: $\forall x (Raven(x) \Rightarrow Black(x))$

Some raven is black: $\exists x (Raven(x) \land Black(x))$

Note the satisfying models of the incorrect $\exists x (Raven(x) \Rightarrow Black(x))$

Another Formalizing Difficulty

Note where a Skolem function appears in

$$\forall x (Parent(x) \Leftrightarrow \exists y childOf(y, x))$$

$$\Leftrightarrow \forall x ((Parent(x) \Rightarrow \exists y childOf(y, x)) \\ \land ((\exists y childOf(y, x)) \Rightarrow Parent(x)))$$

$$\Leftrightarrow \forall x ((\neg Parent(x) \lor \exists y childOf(y, x)) \\ \land (\neg (\exists y childOf(y, x)) \lor Parent(x)))$$

$$\Leftrightarrow \forall x ((\neg Parent(x) \lor \exists y childOf(y, x)) \\ \land (\forall y (\neg childOf(y, x)) \lor Parent(x)))$$

$$\Leftrightarrow \forall x (Parent(x) \Rightarrow childOf(f(x), x))$$
$$\land \forall x \forall y (childOf(y, x) \Rightarrow Parent(x))$$

What's "First-Order" About FOL?

In a first-order logic:

or functions; Predicate and function symbols cannot be arguments of predicates

Variables cannot be in predicate or function position.

is not a first-order sentence E.G. $\forall r[Transitive(r) \Leftrightarrow \forall xyz[r(x,y) \land r(y,z) \Rightarrow r(x,z)]]$

study here from those in which there are predicates having other Raton, FL, 2010, p. 48.] function quantifiers are permitted, or both." [Elliott Mendelson, predicates or functions as arguments or in which predicate quantifiers or "The adjective 'first-order' is used to distinguish the languages we shall Introduction to Mathematical Logic, Fifth Edition, CRC Press, Boca

Russell's Theory of Types

Designed to solve paradox: $\exists s \forall c [s(c) \Leftrightarrow \neg c(c)]$

has instance $S(S) \Leftrightarrow \neg S(S)$

N^{th} -Order Logic

Assign type 0 to individuals and to terms denoting individuals.

symbol that denotes a set, possibly of tuples, such that the maximum type of any of its elements is i. Assign type i + 1 to any set and to any function or predicate

Also assign type i + 1 to any variable that range over type i objects.

 n^{th} element of the n-tuples of the set which the function denotes. Note that the type of a functional term is the type of its range—the

atomic wff is i, then the type of the predicate is i + 1. Syntactically, if the maximum type of the arguments of a ground

No predicate of type i may take a ground argument of type i or

First-Order Logic Defined

Types, and whose highest type symbol is of type 1. First-order logic has a language that obeys Russell's Theory of

 n^{th} -order logic has a language that obeys Russell's Theory of Types, and whose highest type symbol is of type n.

 Ω -ordered logic has no limit, but must still follow the rules.

is a formula of Second-Order Logic: E.g., $\forall r[Transitive(r) \Leftrightarrow \forall xyz[r(x,y) \land r(y,z) \Rightarrow r(x,z)]]$

Type 0 objects: individuals in the domain

Type 2 symbols: r because it ranges over type 1 objects, Type 1 objects: binary relations over type 0 objects Type 1 symbols: x, y, z because they range over type 0 objects Transitive because it denotes a set of type 1 objects

Nested Beliefs

Can a proposition be an argument of a proposition?

Consider:

$$\forall p(Believes(Solomon, p) \Rightarrow p)$$
 $Believes(Solomon, Round(Earth)) \Rightarrow Round(Earth)$
 $Believes(Solomon, Round(Earth))$
 $\models Round(Earth)$

may be arguments of functions and predicates If Round(Earth) is an atomic wff, it's not a term, and only terms

Even if it could:

$$[[Round(Earth)]] = \text{True if } [[Earth]] \in [[Round]], \text{ else False.}$$
So $[[Believes(Solomon, Round(Earth))]] = \text{True}$
iff $\langle [[Solomon]], True-or-False \rangle \in [[Believes]]$

Reifying Propositions and the Holds Predicate

So how can we represent in FOL

"Everything that Solomon believes is true"?

• Reify (some) propositions.

Make them objects in the domain.

Represent them using individual constants or functional terms.

- Use Holds(P) to mean
- "P holds (is true) in the given situation".
- Examples:

 $\forall p(Believes(Solomon, p) \Rightarrow Holds(p))$ $Believes(Solomon, Round(Earth)) \Rightarrow Holds(Round(Earth))$

Semantics of the *Holds* Predicate

 $\forall p(Believes(Solomon, p) \Rightarrow Holds(p)) \land Believes(Solomon, Round(Earth))$ $\Rightarrow Holds(Round(Earth))$

Type 0 individuals and terms:

[Solomon] = [Solomon] = A person named Solomon

[Earth] = [Earth] = The planet Earth

[Round(Earth)] = [[Round(Earth)]] = The proposition that the Earth is round the example of the content of the example of the

Type 1 objects and symbols:

p: A variable ranging over type 0 propositions

[Round] = A function from type 0 physical objects to type 0 propositions.

[Holds] = A set of type 0 propositions.

[Believes] = A set of pairs, type 0 People × type 0 propositions

Type 1 atomic formulas:

[Holds(x)] = The type 1 proposition that [x] is True.

[Holds(x)] = True if [x] $\in [Holds]$; False otherwise

[Believes(x,y)] =The type 1 proposition that [x] believes [y]

 $[Believes(x,y)] = \text{True if } \langle [\![x]\!], [\![y]\!] \rangle \in [\![Believes]\!]; \text{ False otherwise}$

5 Summary of Part I

Artificial Intelligence (AI): A field of computer science and engineering concerned with the computational understanding of creation of artifacts that exhibit such behavior. what is commonly called intelligent behavior, and with the

Knowledge Representation and Reasoning (KR or KRR):

information to derive new information based on it. representing information in computers, and using that understanding, designing, and implementing ways of A subarea of Artificial Intelligence concerned with

else is reasonable for it to believe, and how is it reasonable for it to act, regardless of whether those beliefs are true and justified that an agent (human or computer) has certain beliefs, what KR is more concerned with belief than "knowledge". Given

What is Logic?

Logic is the study of correct reasoning.

specifying: There are many systems of logic (logics). Each is specified by

- Syntax: Specifying what counts as a well-formed expression
- Semantics: Specifying the meaning of well-formed expressions
- Intensional Semantics: Meaning relative to a Domain
- Extensional Semantics: Meaning relative to a Situation
- Proof Theory: Defining proof/derivation, and how it can be extended.

Relevance of Logic

Any system that consists of

- a collection of symbol structures,
 well-formed relative to some syntax;
- a set of procedures for adding new structures to that collection based on what's already in there.

is a logic.

But:

Do the symbol structures have a consistent semantics?

Are the procedures sound relative to that semantics?

Soundness is the essence of "correct reasoning."

KR and Logic

over it is a well-defined procedure, a KR system is a logic. well-defined syntax, a well-defined semantics, and that reasoning Given that a Knowledge Base is represented in a language with a

human-level reasoning. KR research can be seen as a search for the best logic to capture

Inference/Reasoning Methods

Given a KB/set of assumptions \mathcal{A} and a query \mathcal{Q} :

- Model Finding
- Direct: Find satisfying models of \mathcal{A} , see if \mathcal{Q} is True in all of them.
- Refutation: Find if $A \cup \{\neg Q\}$ is unsatisfiable.
- Natural Deduction
- Direct: Find if $A \vdash Q$.
- Resolution
- Direct: Find if $A \vdash Q$ (incomplete).
- Refutation: Find if $\bigwedge A \land \neg Q$ is inconsistent.

Classes of Logics

- Propositional Logic
- Finite number of atomic propositions and models.
- Model finding and resolution are decision procedures.
- Finite-Model Predicate Logic

Finite number of terms, atomic formulae, and models.

- Reducible to propositional logic.

Model finding and resolution are decision procedures.

- First-Order Logic
- Infinite number of terms, atomic formulae, and models.
- Not reducible to propositional logic.
- There are no decision procedures
- Resolution plus factoring is refutation complete.

Logics We Studied

- 1. Standard Propositional Logic
- 2. Clause Form Propositional Logic
- 3. Standard Finite-Model Predicate Logic
- 4. Clause Form Finite-Model Predicate Logic
- 5. Standard First-Order Predicate Logic
- 6. Clause Form First-Order Predicate Logic

Proof Procedures We Studied

- 1. Direct model finding: truth tables, decreasoner, relsat (complete search) walksat, gsat (stochastic search)
- 2. Semantic tableaux (model-finding refutation)
- 3. Wang algorithm (model-finding refutation), wang
- 4. Hilbert-style axiomatic (direct), brief
- 5. Fitch-style natural deduction (direct)
- 6. Resolution (refutation), prover, SNARK

Utility Notions and Techniques

- 1. Material implication
- 2. Possible properties of connectives commutative, associative, idempotent
- 3. Possible properties of well-formed expressions open, closed, ground expressions free, bound variables
- 4. Possible semantic properties of wffs contradictory, satisfiable, contingent, valid
- 5. Possible properties of proof procedures decision procedure, semi-decision procedure sound, consistent, complete

More Utility Notions and Techniques

5. Substitutions
application, composition

6. Unification

most general common instance (mgci), most general unifier (mgu)

- 7. Translation from standard form to clause form Skolem functions/constants Conjunctive Normal Form (CNF),
- 8. Resolution Strategies subsumption, unit preference, set of support
- 9. The Answer Literal

Unification

- substitution for Universal Instantiation $(\forall E)$. Unification is a least-commitment method of choosing a
- Unification is correct pattern matching when both structures have variables.
- Unification is generally needed in backward chaining systems.

6.1 Horn Clauses

A Horn Clause is a clause with at most one positive literal.

Either $\{\neg Q_1(\overline{x}), \dots, \neg Q_n(\overline{x})\}$ (negative Horn clause)

or $\{C(\overline{x})\}$ (fact or positive or definite Horn clause)

or $\{\neg A_1(\overline{x}), \dots, \neg A_n(\overline{x}), C(\overline{x})\}$ (positive or definite Horn clause)

which is the same as

$$A_1(\overline{x}) \wedge \cdots \wedge A_n(\overline{x}) \Rightarrow C(\overline{x})$$

where $A_i(\overline{x})$, $C(\overline{x})$, and $Q(\overline{x})$ are atoms.

SLD Resolution

Selected literals, Linear pattern, over Definite clauses

SLD derivation of clause c from set of clauses S is

$$c_1,\ldots,c_n=c$$

s.t.
$$c_1 \in S$$

and c_{i+1} is resolvent of c_i and a clause in S. [B&L, p. 87]

If S is a set of Horn clauses,

iff there is an SLD derivation of $\{\}$ from S. then there is a resolution derivation of $\{\}$ from S

SLDSolve

```

\+ is SICStus Prolog's version of not.

yes

It is negation by failure, not logical negation.

Avoid Left Recursive Rules

To define ancestor as the transitive closure of parent.

The base case: ancestor(X,Y) :- parent(X,Y)

Three possible recursive cases:

- ancestor(X,Y) := parent(X,Z), ancestor(Z,Y).
- 2. ancestor(X,Y) :- ancestor(X,Z), parent(Z,Y).
- ancestor(X,Y) :- ancestor(X,Z), ancestor(Z,Y).

Versions (2) and (3) will cause infinite loops.

Taxonomies: Categories as Intensional Sets

In mathematics, a set is defined by its members.

This is an extensional set.

Plato: Man is a featherless biped.

An intensional set is defined by properties.

Aristotle: Man is a rational animal.

A category (type, class) is an intensional set.

Taxonomies: Need for Two Relations

With sets, there's a difference between

set membership,
$$\in$$

$$5 \in \{1, 3, 5, 7, 9\}$$

and subset,
$$\subset$$
, \subseteq

$$\{1,3,5,7,9\} \subset \{1,2,3,4,5,6,7,8,9\}$$

One difference is that subset is transitive:

$$\{1,3,5\} \subset \{1,3,5,7,9\} \text{ and } \{1,3,5,7,9\} \subset \{1,2,3,4,5,6,7,8,9\}$$
 and $\{1,3,5\} \subset \{1,2,3,4,5,6,7,8,9\}$

membership is not:

$$5 \in \{1, 3, 5, 7, 9\} \text{ and } \{1, 3, 5, 7, 9\} \in \{\{1, 3, 5, 7, 9\}, \{2, 4, 6, 8\}\}$$
 but $5 \notin \{\{1, 3, 5, 7, 9\}, \{2, 4, 6, 8\}\}$

relation Similarly, we need both the instance relation and the subcategory

Taxonomies:

Categories as Unary Predicates

One way to represent taxonomies:

$$\forall x[(Canary(x) \Rightarrow Bird(x)]$$

$$\forall x[(Canary(x) \Rightarrow Bird(x)]$$

 $\forall x[(Bird(x) \Rightarrow Vertebrate(x)]$

$$\forall x[(Vertebrate(x) \Rightarrow Chordate(x)]$$

$$\forall x[(Chordate(x) \Rightarrow Animal(x)]$$

Taxonomies: Reifying

To reify: to make a thing of.

Allows discussion of "predicates" in FOL.

Membership: Member or Instance or Isa

Isa(Tweety, Canary)

Subcategory: Subclass or Ako (sometimes, even, Isa)

Ako(Canary, Bird)

Ako(Bird, Vertebrate)

Ako(Vertebrate, Chordate)

Ako(Chordate, Animal)

Axioms:

 $\forall c_1 \forall c_2 \forall c_3 [Ako(c_1, c_2) \land Ako(c_2, c_3) \Rightarrow Ako(c_1, c_3)]$ $\forall x \forall c_1 \forall c_2 [Isa(x, c_1) \land Ako(c_1, c_2) \Rightarrow Isa(x, c_2)]$

Page 415

Discussing Categories

Isa(Canary, Species)

Isa(Bird, Class)

Isa(Chordate, Phylum)

Isa(Animal, Kingdom)

Extinct(Dinosaur)

Note: That's Isa, not Ako.

If categories are predicates, requires second-order logic.

partitions Other relationships: exhaustive subcategories, disjoint categories,

DAG (directed acyclic graph), rather than just a tree.

E.g., human: man vs. woman; child vs. adult vs. senior.

Transitive Closure

to have a second relation, R_2 It's sometimes useful (especially in Prolog)

be the transitive closure of a relation, R_1 .

$$\forall R_1, R_2[transitiveClosureOf(R_2, R_1) \Leftrightarrow [\forall x, y(R_1(x, y) \Rightarrow R_2(x, y)) \land \forall x, y, z[R_1(x, y) \land R_2(y, z) \Rightarrow R_2(x, z)]]$$

E.g. ancestor is the transitive closure of parent:

$$\forall x, y[parent(x, y) \Rightarrow ancestor(x, y)]$$

$$\forall x, y, z [parent(x, y) \land ancestor(y, z) \Rightarrow ancestor(x, z)]$$

7.2 Time

How would you represent time?

Discuss

Subjective vs. Objective: Subjective

Make now an individual in the domain.

Include other times relative to now.

OK if time doesn't move.

Subjective vs. Objective: Objective

value. Make now a meta-logical variable with some time-denoting term as

Relate times to each other, e.g. Before(t1, t2).

Now can move by giving now a new value.

Points vs. Intervals: Points

Use numbers: integers, rationals, reals?

Computer reals aren't really dense.

How to assign numbers to times?

Granularity: How big, numerically, is a day, or any other interval of

midpoint in, if one interval immediately follows another? If an interval is defined as a pair of points, which interval is the

Points vs. Intervals: Intervals

Use intervals only: no points at all.

More cognitively accurate.

Granularity is not fixed.

A "point" is just an interval with nothing inside it.

James Allen's Interval Relations

11 (Nov 1983), 832–843.] [James F. Allen, Maintaining Knowledge About Temporal Intervals, Communications of the ACM 26,

A Smaller Set of Temporal Relations

If fewer distinctions are needed, one may use

before(x, y) for Allen's $before(x, y) \lor meets(x, y)$

during(x, y) for Allen's $starts(x, y) \lor during(x, y) \lor finishes(x, y)$

overlaps(x, y) and equals(x, y) and appropriate converses.

Count Nouns vs. Mass Nouns 7.3 Things vs. Substances

A count noun denotes a thing.

Count nouns can be singular or plural.

Things can be counted.

One dog. Two dogs.

A mass noun denotes a substance.

Mass nouns can only be singular.

One can have a quantity of a substance.

A glass of water. A pint of ice cream

A Quantity of a Substance is a Thing

water a substance

 $a \ lake = a \ body \ of \ water \ a \ thing$

lakes a plurality of things

40 acres of lakes a quantity of a substance

Nouns with mass and count senses

A noun might have both senses.

a piece of pie vs. A piece of a pie

two pieces of steak vs. two steaks

Any count noun can be "massified".

Any thing can be put through "the universal grinder".

I can't get up; I've got cat on my lap.

Some of the wffs are asserted.

These denote propositions that the agent believes.

proposition(s), but drawing that inference is optional. The rules of inference sanction believing some additional I.e., the agent is not logically omniscient

8.2 SNePSLOG Syntax Atomic Symbols

Individual Constants, Variables, Function Symbols:

any Lisp symbol, number, or string.

All that matters is the sequence of characters.

I.e. "4", $\setminus 4$, and 4, are the same.

should be distinct, but don't have to be. The sets of individual constants, variables, and function symbols

SNePSLOG Syntax Terms

An individual constant is a term.

A variable is a term.

If t1, ..., tn are terms, then {t1, ..., tn} is a set of terms.

If f is a function symbol or a variable, then f() is a term.

symbol or variable, then f(t1, ..., tn) is a term If t1, ..., tn are terms or sets of terms and f is a function

mistake of formalization otherwise. A function symbol needn't have a fixed arity, but it might be a

SNePSLOG Syntax Atomic Wffs

If x is a variable, then x is a wff.

then P() is a wff. If P is a proposition-valued function symbol or variable,

and P is a proposition-valued function symbol or variable, then P(t1, ..., tn) is a wff. If t1, ..., tn are terms or sets of terms

mistake of formalization otherwise. A predicate symbol needn't have a fixed arity, but it might be a

If $P1, \ldots, Pn$ are wffs, then $\{P1, \ldots, Pn\}$ is a set of wffs.

Abbreviation: If P is a wff, then P is an abbreviation of {P}.

Every wff is a proposition-denoting term.

SNePSLOG Syntax/Semantics AndOr

andor $(i, j) \{P_1, \ldots, P_n\}$ is a wff (proposition-denoting term). and i and j are integers such that $0 \le i \le j \le n$, then If $\{P_1,\ldots,P_n\}$ is a set of wffs (proposition-denoting terms),

The proposition that at least i and at most j of P_1, \ldots, P_n are True.

SNePSLOG Syntax/Semantics Abbreviations of AndOr

$$\tilde{P} = \mathtt{andor}(0,0)\{P\}$$

$$\begin{split} & \text{and} \{P_1, \dots, P_n\} = \text{andor} \, (n,n) \, \{P_1, \dots, P_n\} \\ & \text{or} \{P_1, \dots, P_n\} = \text{andor} \, (1,n) \, \{P_1, \dots, P_n\} \\ & \text{nand} \{P_1, \dots, P_n\} = \text{andor} \, (0,n-1) \, \{P_1, \dots, P_n\} \\ & \text{nor} \{P_1, \dots, P_n\} = \text{andor} \, (0,0) \, \{P_1, \dots, P_n\} \\ & \text{xor} \{P_1, \dots, P_n\} = \text{andor} \, (1,1) \, \{P_1, \dots, P_n\} \\ \end{aligned}$$

$$P_1$$
 and ... and $P_n = \operatorname{andor}(n, n) \{P_1, \ldots, P_n\}$
 P_1 or ... or $P_n = \operatorname{andor}(1, n) \{P_1, \ldots, P_n\}$

SNePSLOG Syntax/Semantics Thresh

and i and j are integers such that $0 \le i \le j \le n$, then thresh(i, j) $\{P_1, \ldots, P_n\}$ is a wff (proposition-denoting term). If $\{P_1,\ldots,P_n\}$ is a set of wffs (proposition-denoting terms)

The proposition that

either fewer than i or more than j of P_1, \ldots, P_n are True.

SNePSLOG Syntax/Semantics Abbreviations of Thresh

$$iff\{P_1,\ldots,P_n\}$$

is an abbreviation of thresh(1, n-1) $\{P_1, \ldots, P_n\}$

$$P_1 \iff \cdots \iff P_n$$

is an abbreviation of thresh(1, n-1) $\{P_1, \ldots, P_n\}$

$$thresh(i)\{P_1,\ldots,P_n\}$$

is an abbreviation of thresh $(i, n-1)\{P_1, \ldots, P_n\}$

SNePSLOG Syntax/Semantics **Numerical Entailment**

(proposition-denoting terms), and i is an integer, $1 \le i \le n$, If $\{P_1, \ldots, P_n\}$ and $\{Q_1, \ldots, Q_m\}$ are sets of wffs $\{P_1,\ldots,P_n\}$ i=> $\{Q_1,\ldots,Q_m\}$ is a wff (proposition-denoting

then so is any $Q_j \in \{Q_1, \ldots, Q_m\}$. The proposition that whenever at least i of P_1, \ldots, P_n are True,

Abbreviations of Numerical Entailment SNePSLOG Syntax/Semantics

$$\{P_1, \dots, P_n\} => \{Q_1, \dots, Q_m\}$$

is an abbreviation of $\{P_1, \dots, P_n\}$ 1=> $\{Q_1, \dots, Q_m\}$
 $\{P_1, \dots, P_n\}$ v=> $\{Q_1, \dots, Q_m\}$
is also an abbreviation of $\{P_1, \dots, P_n\}$ 1=> $\{Q_1, \dots, Q_m\}$
 $\{P_1, \dots, P_n\}$ &=> $\{Q_1, \dots, Q_m\}$
is an abbreviation of $\{P_1, \dots, P_n\}$ n=> $\{Q_1, \dots, Q_m\}$

SNePSLOG Syntax/Semantics Universal Quantifier

If P is a wff (proposition-denoting term)

and x_1, \ldots, x_n are variables, then

all (x_1,\ldots,x_n) (P) is a wff (proposition-denoting term).

The proposition that for every sequence of ground terms, t_1, \ldots, t_n , $P\{t_1/x_1,\ldots,t_n/x_n\}$ is True.

SNePSLOG Syntax/Semantics Numerical Quantifier

are integers such that $0 \le i \le j \le k$, then If \mathcal{P} and \mathcal{Q} are sets of wffs, x_1, \ldots, x_n are variables, and i, j, and k

nexists(i, j, k) (x_1, \dots, x_n) $(\mathcal{P}: \mathcal{Q})$ is a wff.

 t_1, \ldots, t_n , that satisfy every $P \in \mathcal{P}$, and, of them, at least i and at most j also satisfy every $Q \in \mathcal{Q}$. The proposition that there are k sequences of ground terms,

Abbreviations of Numerical Quantifier SNePSLOG Syntax/Semantics

nexists($_{-}$, j, $_{-}$)(x_1,\ldots,x_n)(\mathcal{P} : \mathcal{Q})

is an abbreviation of nexists $(0, j, \infty)$ (x_1, \ldots, x_n) $(\mathcal{P}:$

nexists(i, $_{-}$, k)(x_1, \ldots, x_n)(\mathcal{P} : \mathcal{Q})

is an abbreviation of nexists(i, k, k)($x_1, ..., x_n$)(\mathcal{P} :

SNePSLOG Syntax/Semantics Wffs are Terms

Every wff is a proposition-denoting term.

So, e.g., Believes (Tom, ~Penguin (Tweety)) is a wff, and a well-formed term.

For a more complete, more formal syntax, see The SNePS 2.7.1 User's Manual,

http://www.cse.buffalo.edu/sneps/Manuals/manual271.pdf.

Implemented Rules of Inference 8.3 SNePSLOG Proof Theory Reduction Inference

Reduction Inference₁: If α is a set of terms and $\beta \subset \alpha$, $P(t_1,\ldots,\alpha,\ldots t_n) \vdash P(t_1,\ldots,\beta,\ldots t_n)$

Reduction Inference₂: If α is a set of terms, and t $P(t_1,...,\alpha, ...t_n) \vdash P(t_1, ..., t, ...t_n)$

Example of Reduction Inference

Contradictions

The Contradiction

?x(whale)?

The contradiction involves the newly derived proposition: A contradiction was detected within context default-defaultct

wff6!: Mammal(whale)

and the previously existing proposition:

wff7!: ~Mammal(whale)

You have the following options:

- [C] ontinue anyway, knowing that a contradiction is derivable;
- [R]e-start the exact same run in a different context which is not inconsistent;
- 3. [D]rop the run altogether.

(please type c, r or d)

=><= d

SNePSLOG Demonstrations

Available demonstrations:

- Socrates Is he mortal?

Your choice (q to quit):

8.5 Reasoning Heuristics

Logically equivalent SNePSLOG wffs

are interpreted differently by the SNePS Reasoning System.

v=>-Elimination

Instead of

which would require or-I followed by =>-E

Have

which requires only v=>-E

Example of v=>-E

```
: P().
                                                                                              Since wff4!: {Q(),P()} v=> {R()}
                                                                                                                                                                                                                                                                                                                                                                                                                                                                    : {P(), Q()} v=> R().

=> Is Not Material Implication

If \Rightarrow is material implication,

$$\neg (P \Rightarrow Q) \Leftrightarrow (P \land \neg Q)$$

and

$$\neg(P\Rightarrow Q) \models P$$

But $(p \Rightarrow q)$ just means that its not the case that $p \Rightarrow q$:

; ()q:

• •

Instead of Material Implication Use or

```

```

Motivation

Disbelieving an Hypothesis

```
perform disbelieve(OnFloor(1))
```

```
list-asserted-wffs
```

```
wff5!:
                                                    wff7!:
                                                                                                 {OnFloor(4),OnFloor(3)} v=> {Location(aboveGround)}
xor{OnFloor(4),OnFloor(3),OnFloor(2),OnFloor(1)}
                                               {OnFloor(2),OnFloor(1)} v=> {Location(belowGround)}
```

Note the absence of Location(belowGround)

Moral

If retain derived beliefs (lemmas), need a way to delete them when their foundations are removed.

When Needed 1

and the world changes, If the KB contains beliefs about the (some) world,

and the KB does not have a model of time.

I.e. the beliefs in the KB are of the form, I believe this is true now.

What's needed

Links from hypotheses to propositions derived from them.

vs. when (ever) do: Assertions

```
perform withall(f, Floor(f),
                                                                                                                                                                                                                                                 {OnFloor(3), OnFloor(4)} => {Location(aboveGround)}
                                                                                                                                                                                                                                                                                              {OnFloor(1), OnFloor(2)} => {Location(belowGround)}.

                                                                                                                                                                                                                                                                                                                                                                                                                        ^{\sim}OnFloor(3)
                                                                                                                                                                                                                                                                                                                                                                                                                                                ~OnFloor(2)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ~OnFloor(1)
```

HaveBeenOnFloor(1) remains; OnFloor(1) doesn't.

Moral

The consequents of

are derived and retain a connection to their underlying hypotheses. =>, v=>, &=>, or, nand, xor, iff, andor, thresh, and nexists

Whatever is believe'd is a hypothesis.

for logical implications Use =>, v=>, &=>, or, nand, xor, iff, andor, thresh, and nexists

for decisions Use whendo (p1,believe(p2)) or wheneverdo (p1,believe(p2))

Contingent Plans

```
perform believe(Location(home))
                                                                                                                                                                                                                                                                                                                                                              Location(home) => ActPlan(getMail, go(mailBox)).
                                                                                                                                                                                                                                                                                                                                                                                                        Location(BellHall) => ActPlan(getMail, go(MailRoom))
                                                                                                                                                                                                                                                                                                                                                                                                                                                          xor{Location(BellHall), Location(home)}.

```

Moral

Using this design for contingent plans, along with retention of lemmas, depends on belief revision.

Motivation

Sea Creatures

- $all(x)(andor(0,1){Ako(x, mammal), Ako(x, fish)}).$
- all(x)(LiveIn(x, water) => Ako(x, fish)).
- all(x)(BearYoung(x, live) => Ako(x, mammal)).
- LiveIn(whales, water).
- : LiveIn(sharks, water).
- : BearYoung(whales, live).
- BearYoung(dogs, live).

Motivation

Are Whales Fish or Mammals?

```
Ako(whales, ?x)?
```

A contradiction was detected within context default-defaultc The contradiction involves the newly derived proposition: wff8!: Ako(whales, mammal)

```
and
                       the previously existing proposition:
 wff9!:
~Ako(whales,mammal)
```

SNeBR Options

You have the following options:

- [C] ontinue anyway, knowing that a contradiction is derivab.
- [R]e-start the exact same run in a different context which not inconsistent;
- 3. [D]rop the run altogether.

(please type c, r or d)

J =><=

one hypothesis from each of the following sets of hypotheses: In order to make the context consistent you must delete at leas (wff6 wff4 wff3 wff2 wff1)

Possible Culprits

In order to make the context consistent you must delete at least one hypothesis from the set listed below.

```
An
inconsistent set of hypotheses:
```

```
wff6!: BearYoung(whales, live)
```

(2 supported propositions: (wff8 wff6))

wff4!: LiveIn(whales, water)

(3 supported propositions: (wff10 wff9 wff4))

wff3!: all(x)(BearYoung(x,live) => Ako(x,mammal))

 ω

(2 supported propositions: (wff8 wff3))

wff2!: all(x)(LiveIn(x, water) => Ako(x, fish))

(3 supported propositions: (wff10 wff9 wff2))

wff1!: all(x)(nand{Ako(x,fish),Ako(x,mammal)})

ഗ

(2 supported propositions: (wff9 wff1))

Choosing the Culprit

Enter the list number of a hypothesis to examine or

- [d] to discard some hypothesis from this list,
- <u>a</u> to see ALL the hypotheses in the full context
- [r]to see what you have already removed,
- [q] to quit revising this set, or
- [i] for instructions

(please type a number OR d, a, r, q or i)

=><= d

=><= 4 Enter the list number of a hypothesis to discard, [c] to cancel this discard, or [q] to quit revising this set.

Remaining Possible Culprits

```
The consistent set of hypotheses:
                                                                                                                                                                                                                                                                                   Enter the list number of a hypothesis to examine or
(please type a number OR d, a, r, q or i)
                                                                                        [q] to quit revising this set, or
                                                                                                                                                                                                                                      [d] to discard some hypothesis from this list
                                               for instructions
                                                                                                                                           to see what you have already removed.
                                                                                                                                                                                       to see ALL the hypotheses in the full context,
                                                                                                                                                                                                                                                                                                                                                                            wff1!: all(x)(nand{Ako(x,fish),Ako(x,mammal)})
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           wff6!: BearYoung(whales,live)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         wff3!: all(x)(BearYoung(x,live) => Ako(x,mammal))

Moral When Needed 2

and to delete it, or just one possibly inconsistent source, and to find the culprit, need a way to recognize contradictions, If accepting information from multiple sources,

and its implications.

What's Needed

Links between derived propositions and hypotheses they were derived from.

9.2 Relevance Logic (R) Motivation

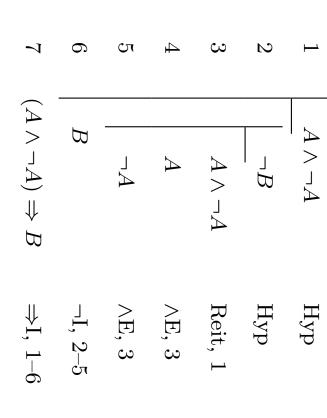

Paradoxes of Implication 1 Anything Implies a Truth

1
$$A$$
 Hyp
2 B Hyp
3 A Reit, 1
4 $B \Rightarrow A$ $\Rightarrow I, 2-3$
5 $A \Rightarrow (B \Rightarrow A)$ $\Rightarrow I, 1-4$

But it seems that B had nothing to do with deriving A.

Motivation of R

A Contradiction Implies Anything Paradoxes of Implication 2

But it seems that $\neg B$ had nothing to do with deriving the contradiction.

What's Needed

another wff. A way to determine when a hypothesis is really used to derive

When a hypothesis is **relevant** to a conclusion.

9.3 R

The Logic of Relevant Implication Relevance Logic

Syntax: The same as Standard FOL.

Intensional Semantics: The same as Standard FOL.

For wffs: a four-valued logic, using True, False, Neither, and Both. Extensional Semantics: The same as Standard FOL for terms.

KB Interpretations of R's 4 Truth Values

True true

False false

Neither unknown

Both contradictory, "I've been told both."

or a "true contradiction"

such as Russell's set both is and isn't a member of itself.

Structural Rules of Inference 9.4 R Proof Theory

	j.		<i>i</i> .				i.
	$\mid A, lpha$	•••	A, α				$A, \{n\}$ Hyp
where	Rep,i						Hyp
n is a	<i>j</i>						<i>i</i> .
where n is a new integer.	$igg A, lpha \ Reit, lpha$	•••	•	•	•	•••	A, α

Page 542

R Rules for \Rightarrow

$$i. \qquad A, \{n\} \qquad Hyp \qquad i. \quad A, \alpha$$

$$\vdots$$

$$j. \qquad B, \alpha, s.t. \ n \in \alpha \qquad j. \quad (A \Rightarrow B), \beta$$

$$k \qquad (A \Rightarrow B), \alpha - \{n\} \quad \Rightarrow I, i-j \qquad k. \quad B, \alpha \cup \beta$$

 $\Rightarrow E, i, j$

Page 543

How the Paradoxes of Implication are Blocked 1

Can't then apply $\Rightarrow I$

R Rules for \wedge

$$i_1.$$
 A_1, α

$$A_n, \alpha$$

$$i_n$$
. A_n, α
 j . $A_1 \wedge \cdots \wedge A_n, \alpha \wedge I, i_1, \dots, i_n$

$$i. \mid A_1 \wedge \cdots \wedge A_n, \alpha$$

$$j. \mid A_k, \alpha$$

$$\wedge E, i$$

Why $\wedge I$ Requires the Same OS If Not

1
$$A, \{1\}$$
 Hyp, 2-5
2 $B, \{2\}$ Hyp, 3-5
3 $A, \{1\}$ Reit, 1
4 $(A \land B), \{1, 2\}$ $\land I$?
5 $A, \{1, 2\}$ $\land E, 4$
6 $(B \Rightarrow A), \{1\}$ $\Rightarrow I, 2-5$
7 $(A \Rightarrow (B \Rightarrow A)), \{\}$ $\Rightarrow I, 1-6$

Reconstruct paradox of implication.

Note: Empty os means a theorem.

Extended Rule for $\wedge I$

$$egin{array}{lll} i_1. & A_1,lpha \ & dots \ i_n. & A_n,\eta \ & & & \ j. & A_1\wedge\dots\wedge A_n, (lpha\cup\dots\cup\eta)^* & \wedge I, i_1,\dots,i_n \ \end{array}$$

Can't apply $\wedge E$ to an extended wff.

$\neg A$,	$A,\{1\}$	$(A \land \neg A), \{1\}$	$-B, \{2\}$	$(A \land \neg A), \{1\}$
$A,\{1\}$				
$\wedge E, \beta$	$\wedge E, 3$	Reit, 1	Hyp	Hyp

Can't then apply $\neg I$

R is a paraconsistent logic:

a contradiction does not imply anything whatsoever.

Page 550

R Rule for $\vee I$

$$i.$$
 $A_i, lpha$ $j.$ $A_1 \lor \cdots \lor A_i \lor \cdots \lor A_n, lpha \lor I, i$

R Rule for $\vee E$

$$i_1. \mid A_1 \vee \cdots \vee A_n, \alpha$$

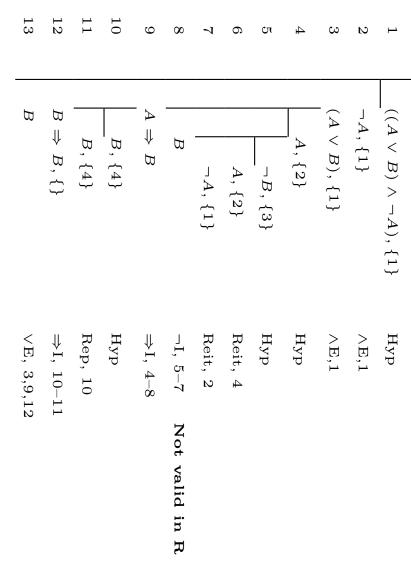

$$A_1 \Rightarrow B, \beta$$

$$i_3.$$
 $A_n \Rightarrow B, \beta$ $j.$ $B, \alpha \cup \beta$

$$B, \alpha \cup k$$

$$\forall E, i_1, i_2, i_3$$

Irrelevance of Disjunctive Syllogism

So \vee is just truth-functional.

R Rules for Intensional OR (\oplus)

$$i.$$
 $(\neg A \Rightarrow B), \alpha$ \vdots \vdots $(\neg B \Rightarrow A), \alpha$ $j.$ $(\neg B \Rightarrow A), \alpha$ $(A \oplus B), \alpha \oplus I, i, j$

$$i.$$
 $(A \oplus B), \alpha$ $i.$

 $\oplus E$

R Rules for \Leftrightarrow

$$i.$$
 $(A \Rightarrow B), \alpha$
 \vdots
 $j.$ $(B \Rightarrow A), \alpha$
 $j+1.$ $(A \Leftrightarrow B), \alpha \Leftrightarrow I, i, j$
 A, α \vdots
 \vdots
 $(A \Leftrightarrow B), \beta$ $\Rightarrow E, i, j$ $j+1.$

 B, α

Page 555

 $(A \Leftrightarrow B), \beta$

 $A, \alpha \cup \beta \quad \Leftrightarrow E, i, j$

R Rules for \forall

and t is free for x in B(x). Where a is an arbitrary individual not otherwise used in the proof,

Note \forall only governs \Rightarrow .

R Rules for \exists

a is an indefinite individual not otherwise used in the proof, t is free for x in A(x); Where A(x) is the result of replacing some or all occurrences of t in A(t) by x,

Page 557

and there is no occurrence of a in B.

A(a/x) is the result of replacing all occurrences of x in A(x) by a,

Why the Subproof Contours?

- 1. To keep track of assumptions for each derived wff. But this is accomplished by os.
- 2. To differentiate hypotheses from derived wffs. with origin tag and origin set. Introduce support: $\langle \{hyp \mid der \mid ext\}, os \rangle$

SNePS KB

The SNePS KB consists of a collection of supported wffs

A wff may have more than one support if it was derived in multiple

support(s) of its parent(s). derived from its parent(s) and how its support is derived from the Every implemented rule of inference specifies how the derived wff is

Contexts and Belief Spaces

A context is a set of hypotheses.

whose os is a subset of c. A belief space defined by a context c is the set containing every wff

SNePSLOG Example

10 The Situation Calculus

Motivation (McCarthy)

drive to the airport, rather than vice versa? the airport. How do I decide that I should walk to the garage and I'm in my study at home. My car is in the garage. I want to get to

A commonsense planning problem.

Solution Sketch

My study and garage are in my home.

To get from one place to another in my home, I should walk.

My garage and the airport are in the county.

To get from one place to another in the county, I should drive.

Situations

and some are independent of acting. When an agent acts, some propositions change as a result of acting,

acting, but whether I'm in my study, in the garage, or at the airport, changes when I act. E.g. the fact that the airport is in the county is independent of my

We say that an act takes us from one situation to another.

vs. In(study, home), In(airport, county)propositional fluents. E.g. At(study, S0), At(garage, S1)Propositions that are dependent on situations are called

Situational Fluents

and takes us to another situation. We can view an act as something that's done in some situation,

Let do(a, s) be a two-argument functional term.

situation [s]. $\llbracket do(a,s) \rrbracket = \text{the situation that results from doing the act } \llbracket a \rrbracket \text{ in the }$

So, At(study, S0), At(garage, do(walk(study, garage), S0))

Planning in the Situational Calculus

Describe the situation S0.

Give domain rules describing the effects of actions.

Find a solution for At(airport, ?s)

How do you achieve holding Block A?
                                                                                                                                                                                                                                    (query "How do you achieve holding Block A?"
(ask '(Held A ?s)) = (By doing (do (pickUp A) S0))
                                                                                                                                          :answer '(By doing ?s))
                                                                                                                                                                                            '(Held A ?s)
```

A Harder Problem

```
(query "How do you put Block A on Block C"
:answer '(By doing ?s))
                                  '(On A C ?s)
```

Just loops!

The Frame Problem

We want

(On A C (do (putOn A C) (do (pickUp A) SO)))

but this requires C to be clear in situation

(do (pickUp A) SO)

That can't be decided.

an action is performed. We need to specify what propositional fluents don't change when

A Frame Axiom

```
(assert
                                      '(all (x y s) (=> (and (Clear x s) (not (= x y)))
(Clear x (do (pickUp y) s)))))
```

Another Problem

Still doesn't work, because we don't know that

(not (= C A))

Unique Names Axioms

```
after (initialize)
                                                                    Also need
                                  (use-paramodulation)
                                                                                                                                              (assert '(not (= A B)))
                                                                                                   (assert '(not (= B C)))
                                                                                                                       (assert '(not (= A C)))
```

This includes the theory of equality with resolution.

Success!

(query "How do you put Block A on Block C" '(On A C ?s) :answer '(By doing ?s))

How do you put Block A on Block C = (By doing (do (putOn A C) (do (pickUp A) SO))) (ask '(On A C ?s))

11 Summary

Artificial Intelligence (AI): A field of computer science and engineering concerned with the computational understanding of creation of artifacts that exhibit such behavior. what is commonly called intelligent behavior, and with the

Knowledge Representation and Reasoning (KR or KRR):

representing information in computers, and using that information to derive new information based on it. understanding, designing, and implementing ways of A subarea of Artificial Intelligence concerned with

else is reasonable for it to believe, and how is it reasonable for it to act, regardless of whether those beliefs are true and justified that an agent (human or computer) has certain beliefs, what KR is more concerned with belief than "knowledge". Given

What is Logic?

- Logic is the study of correct reasoning.
- There are many systems of logic (logics). Each is specified by specifying:
- Syntax: Specifying what counts as a well-formed expression
- Semantics: Specifying the meaning of well-formed expressions
- * Intensional Semantics: Meaning relative to a Domain
- Extensional Semantics: Meaning relative to a Situation
- extended. Proof Theory: Defining proof/derivation, and how it can be

KR and Logic

over it is a well-defined procedure, a KR system is a logic. well-defined syntax, a well-defined semantics, and that reasoning Given that a Knowledge Base is represented in a language with a

human-level reasoning. KR research can be seen as a search for the best logic to capture

Inference/Reasoning Methods

Given a KB/set of assumptions \mathcal{A} and a query \mathcal{Q} :

- Model Finding
- Direct: Find satisfying models of A; see if Q is true in all of them.
- Refutation: Find if $A \cup \{\neg Q\}$ is unsatisfiable.
- Natural Deduction
- Direct: Find if $A \vdash Q$.
- Resolution
- Direct: Find if $A \vdash Q$ (incomplete).
- Refutation: Find if $\bigwedge A \land \neg Q$ is inconsistent.

Logics We Studied

- 1. Standard Propositional Logic
- 2. Clause Form Propositional Logic
- 3. Standard Finite-Model Predicate Logic
- 4. Clause Form Finite-Model Predicate Logic
- 5. Standard First-Order Predicate Logic
- 6. Clause Form First-Order Predicate Logic
- 7. Horn Clause Logic
- 8. Relevance Logic
- 9. SNePSLOG & SNeRE
- 10. The Situation Calculus
- 11. Description Logics

Classes of Logics

- Propositional Logic
- Finite number of atomic propositions and models.
- Model finding and resolution are decision procedures.
- Finite-Model Predicate Logic

Finite number of terms, atomic formulae, and models.

- Reducible to propositional logic.

Model finding and resolution are decision procedures.

- First-Order Logic
- Infinite number of terms, atomic formulae, and models.
- Not reducible to propositional logic.
- There are no decision procedures
- Resolution plus factoring is refutation complete.

Proof Procedures We Studied

- 1. Direct model finding: truth tables, decreasoner, relsat (complete search) walksat, gsat (stochastic search)
- 2. Wang algorithm (model-finding refutation), wang
- 3. Semantic tableaux (model-finding refutation)
- 4. Hilbert-style axiomatic (direct), brief
- 5. Fitch-style natural deduction (direct)
- 6. Resolution (refutation), prover, SNARK
- 7. SLD resolution (refutation), Prolog
- 8. SNePS (direct), SNePS

Utility Notions and Techniques

- 1. Material implication
- 2. Possible properties of connectives commutative, associative, idempotent
- 3. Possible properties of well-formed expressions open, closed, ground expressions free, bound variables
- 4. Possible semantic properties of wffs contradictory, satisfiable, contingent, valid
- 5. Possible properties of proof procedures decision procedure, semi-decision procedure sound, consistent, complete

More Utility Notions and Techniques

5. Substitutions application, composition

6. Unification

most general common instance (mgci), most general unifier (mgu)

- 7. Translation from standard form to clause form Skolem functions/constants Conjunctive Normal Form (CNF),
- 8. Resolution Strategies subsumption, unit preference, set of support
- 9. The Answer Literal

Yet More Utility Notions and Techniques

- 9. Closed vs. Open World Assumption
- 10. Negation by failure
- 11. Origin sets, contexts
- 12. Belief Revision/Truth-Maintenance

Domain Modeling

- 1. Formalization in various logics
- 2. Reification
- 3. Ontologies/Taxonomies/Hierarchies
- extensional *vs.* intensional
- instance vs. subcategory
- Single (DAGs) vs multiple inheritance
- transitive relations/transitive closure
- mutually exclusive/disjoint categories
- exhaustive set of subcategories
- partitioning of a category

More Domain Modeling

- 4. Time
- subjective vs. objective
- points vs. intervals
- Allen's relations
- 5. Things (Count Nouns) vs. Substances (Mass Nouns)
- 6. Acting
- situations
- fluents

Working (Short-term) Memory 12 Production Systems Architecture

Each being a rather flat, ground (no variables) symbol structure. Contains set (unordered, no repeats) of Working Memory Elements (WMEs).

Rule (Long-term) Memory

Contains set (unordered, no repeats) of

Production Rules.

Each being a condition-action rule

of form

if condition₁ ... condition_n then action₁ ... action_m Each condition and action being like a WME,

but allowing variables (and, maybe, other expressions)

Rule Triggering

such that each condition_i σ is a WME. if there is a substitution, σ is triggered A rule if condition₁ ... condition_n then action₁ ... action_m

substitutions). A single rule can be triggered in multiple ways (by multiple

Rule Firing

fires by performing every $action_i\sigma$. that is triggered in a substitution σ A rule if condition₁ ... condition_n then action₁ ... action_m

Production System Execution Cycle

loop

Collect $\mathcal{T} = \{ r\sigma \mid r\sigma \text{ is a triggered rule} \}$

if \mathcal{T} is not empty

Choose a $r\sigma \in \mathcal{T}$

Fire $r\sigma$

until \mathcal{T} is empty.

Some Typical Actions

- stop
- delete a WME
- add a WME
- modify a WME
- formatted print

Conflict Resolution Strategies

Purpose: to "Choose a $r\sigma \in \mathcal{T}$ "

rule, choose the second rule. [B & L, p. 126] Specificity: If the conditions of one rule are a subset of a second

or on recency of a rule firing. [B & L, p. 126] Recency: Based on recency of addition or modification of WMEs,

to fire again. [B & L, p. 127] Refactoriness: Don't allow the same substitution instance of a rule

discouraged" [http://herzberg.ca.sandia.gov/jess/docs/70/ rules.html#salience]. Salience: Explicit salience value. "The use of salience is generally

The Rete Algorithm Assumptions

Rule memory doesn't change.

WM changes only slightly on each cycle.

WMEs are ground.

Production Systems are data-driven (use forward chaining).

Many rules share conditions.

The Rete Network

with rules at the leaves Create a network from the conditions (Like a discrimination tree)

Create a token for each WME.

satisfy a test; resuming when the WME is modified. Pass each token through the network, stopping when it doesn't

When tokens reach a leaf, the rule is triggered.

Kinds of branch nodes

 α nodes: Simple test.

 β nodes: Constraints caused by different conditions.

DL: Main Ideas

• Terminological Box or T-Box.

Definition of *Concepts* ("Classes") and *Roles* ("Properties").

• Assertional Box or A-Box.

Assertions about individuals (instances)

- Unary predicates = concepts
- Binary predicates = roles
- Necessary and Sufficient conditions on classes.
- Subsumption Hierarchy

Syntax of a Simple DL^a Atomic Symbols

- Positive integers: 1, 2, 3
- Atomic concepts: Thing, Pizza, PizzaTopping, PizzaBase Thing is the top of the hierarchy.
- Roles: hasTopping, hasBase
- Constants: item1, item2

Stevens, & Chris Wroe, A Practical Guide To Building OWL Ontologies Using from Matthew Horridge, Simon Jupp, Georgina Moulton, Alan Rector, Robert Protégé 4 and CO-ODE Tools: Edition 1.1, The University of Manchester, 2007. and Reasoning, Morgan Kaufmann/Elsevier, 2004, Chapter 9, with examples ^aFrom Ronald J. Brachman & Hector J. Levesque, Knowledge Representation

Syntax of a Simple DL Concepts

- Every atomic concept is a concept
- If r is a role and d is a concept, [ALL r d] is a concept. E.g., [ALL hasTopping VegetarianTopping] The concept of individuals all of whose r's are d's.
- If r is a role and n is a positive integer, [EXISTS n r] is a concept. E.g., [EXISTS 1 hasTopping] The concept of individuals that have at least $n r^2$ s.
- If r is a role and c is a constant, [FILLS r c] is a concept. E.g., [FILLS hasTopping item2] The concept of individuals one of whose r's is c.
- If d_1, \ldots, d_n are concepts, [AND d_1, \ldots, d_n] is a concept E.g., [AND Pizza [EXISTS 1 hasTopping] The concept that is the intersection of d_1, \ldots, d_n . [ALL hasTopping VegetarianTopping]]

Syntax of a Simple DL Sentences

- If d_1 and d_2 are concepts, $(d_1 \sqsubseteq d_2)$ is a sentence. E.g., VegetarianPizza ⊑ Pizza d_1 is subsumed by d_2
- If d_1 and d_2 are concepts, $(d_1 = d_2)$ is a sentence. E.g., VegetarianPizza \doteq [AND Pizza [EXISTS 1 hasTopping] d_1 and d_2 are equivalent [ALL hasTopping VegetarianTopping]]
- If c is a constant and d is a concept, $(c \rightarrow d)$ is a sentence. E.g., item $1 \rightarrow Pizza$ The individual c satisfies the description expressed by d.

Necessary and Sufficient Conditions

an individual, c, is an instance of d, it is **necessary** that c satisfy p. A **necessary** condition on a class, d, is a property, p, such that if

an individual, c, satisfies p, then that is a **sufficient** reason to decide that it is an instance of d. A sufficient condition on a class, d, is a property, p, such that if

A **primitive** concept has only necessary conditions A defined concept has both necessary and sufficient conditions.

Subsumption Hierarchy

 $(d_1 \sqsubseteq d_2)$

 d_1 is subsumed by d_2

E.g., VegetarianPizza ⊑ Pizza

means that every instance of d_1 is an instance of d_2 .

Every DL concept is subsumed by Thing, the top of the hierarchy.

Classification Algorithm

the subsumption hierarchy. Decision procedure for placing every defined concept correctly in

Note: Two concepts that subsume each other are the same.

Note: No concept can be computed as being subsumed by a primitive concept.

Examples Using Classic

```
*WARNING*: The new concept PizzaTopping is identical
                                              : (cl-define-concept 'PizzaTopping 'Classic-Thing)
                                                                                                                                                                                                          (cl-startup)
                                                                                                                                                                                                                                                                                                                  Defined and Primitive Concepts
```

```
@c{PizzaBase}
                                                 : (cl-define-primitive-concept 'PizzaBase 'Classic-Thing)
```

@c{Classic-Thing}

to the existing concept @c{Classic-Thing}.

Creating An Individual

```
@i{base1}
                                                                                                                                                                                 Base1 ->
                                                                                                                                                                                                                                                                                                                                                                                                  @i{base1}
                                                                                                                                                                                                                                                                                                                                                                                                                                  : (cl-create-ind 'base1 'PizzaBase)

Typology of DL Languages

Construct	Syntax		Language	nge	
Concept	A				
Role name	R	FL_0			
Intersection	$C \cap D$				
Value Restriction	$\forall R.C$		FL-		
Limited existential quantification	∃R.⊤			AL	
Top or Universal	\top				∞
Bottom					
Atomic negation	$\neg A$				
Negation	$\neg C$		С		
Union	$C \cup D$		U		
Existential restriction	BR.C	1	H		
$\frac{1}{2} \frac{1}{2} \frac{1}$	±	2 22			

Language $S = ALC_{R+} = ALC$ plus transitive roles.

From A. Gòmez-Pèrez, M. Fernàndez-Lòpez & O. Corcho, *Ontological Engineering*, Springer-Verlag, London, 2004, Table 1.1, p. 17.

Typology, continued

Construct	Syntax	Language
Number restrictions	$(\geq n R) (\leq n R)$	N
Nominals	$\{a_1 \dots a_n\}$	0
Role hierarchy	$R \subseteq S$	Н
Inverse role	R'	I
Qualified number restriction	(≥ n R.C) (≤ n R.C)	Q

Key to abbreviations under "Syntax":

A: atomic concept

C, D: concept definitions

R: atomic role

S: role definition

London, 2004, Table 1.1, p. 17. From A. Gòmez-Pèrez, M. Fernàndez-Lòpez & O. Corcho, Ontological Engineering, Springer-Verlag,

14 Abduction

Abduction is the non-sound inference

from

$$P \Rightarrow Q$$

and Q

to

D

See Brachman & Levesque, Chapter 13.

Some Uses of Abduction

1. Explanation

from $It's\ raining \Rightarrow The\ grass\ is\ wet$ and $The\ grass\ is\ wet$ to $It's\ raining$

2. Diagnosis

from $Infection \Rightarrow Fever$ and Fever to Infection

3. Plan Recognition

from $Cooking\ pasta \Rightarrow Boil\ water$ and $Boil\ water$ to $Cooking\ pasta$

4. Text Understanding

and Betty left a big tip. to Betty got good service. from $\forall x (gotGoodService(x)) \Rightarrow leftBigTip(x))$

Prime Implicates

Applies to KRR using resolution.

For some KB and some clause C, if

 $KB \models C$

and for any C' s.t. C' is a proper subset of C

 $KB \not\models C'$

C is a prime implicate of KB.

Example of Computing Prime Implicate

```
prover(4): (prove '( (=> (and p q r) g)
                                                                                                                                                                                                           (p (not q) g) (q (not r) g)
